NOTICE

HP-85

Standard Pac

February 1981

00085-90003 Rev. D

Printed in U.S.A.

Introduction

The Standard Pac has been designed to provide you with many immediate solutions to a wide spectrum of computational problems. The programs deal with business, science, and engineering, as well as providing enjoyable programs such as Music Composer, Biorhythms, and the Ski Game.

A knowledge of programming is not needed to use most of the programs in the Standard Pac. However, you should be familiar with sections *1* through *5* of the Owner's Manual. Some of the programs require you to store a function as part of the program. You should be able to do this after reading the programming section of the Owner's Manual. The examples for these programs should also prove helpful to beginning users.

For each program in the Standard Pac, there is a description, user instructions, examples, and commented program listings (at the back of this manual).

The Standard Pac also contains explanations of important programming techniques which have been used in the programs. Many of these techniques can be used in your own programs. The titles and page numbers of these explanations may be found at the beginning of the appendix.

Before running any of the Standard Pac programs, you should define the output peripherals to your needs. Most of the programs assume that the printer is 2 and the CRT is 1 and use PRINT and DISP statements accordingly. If you want to ensure that the peripherals are defined as the programs assume, press (RESET) before running a program. The currently defined key labels are obtainable at any time while a program is running by pressing (KEY LABEL). Remember to press (CLEAR -LINE) before pressing (END LINE) if the key labels are in the input line. All files on the Standard Pac cartridge have been secured using a security code of HP and a security type of 2. To store a changed version of a program, you must first unsecure the file using HP as the security code and 2 as the security type.

We hope that these programs prove helpful in your daily calculations.

Contents

Format of User Instructions

The user instructions, which accompany each program, are your guide to operating the programs in this Pac.

Certain key words have been used to indicate specific types of operations. You should become familiar with the meanings of these words so that the intent of the user instructions can then easily be followed.

Key Word	Meaning/Use
INSERT	Put the tape cartridge into the tape transport
PRESS	Push an immediate executable key, e.g., (END LINE) or (RUN)
TYPE	Push a series of keys which form a command, e.g., Type: (REW LOAD) "CALEND"
ENTER	Push a series of keys as a response to a machine prompt, e.g., Enter: The name of the file.
GO TO Step n	Change the flow in the user instructions
REPEAT	Designates a repeatable group of instructions
NOTE:	Extra comments concerning instructions for this step

The user instructions are written in outline form so that you can easily follow the instructions and the flow of operation. All of the programs have been designed with a "HELP" section which displays more detailed information concerning the operation of a program than the labels on the special function keys. After running a program using the written user instructions a few times, you should be able to run the programs without referring to the user instructions and use the "HELP" option to refresh your memory.

Running a Program

Loading a Program

The Standard Pac cartridge contains fifteen programs which are all accessible in the same manner. You can obtain a listing of the programs on the tape by doing a catalogue as follows:

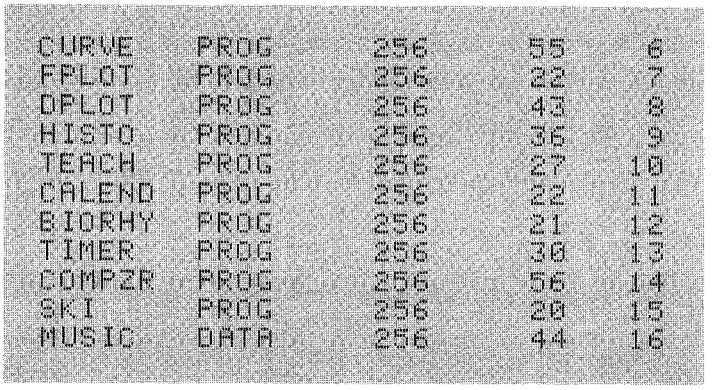
Insert the Standard Pac cartridge into the tape transport with the label up.

Type: CAT

Press: (END LINE)

Your catalogue should look like this:

```
NAME      TYPE    BYTES    RECS FILE
MOVING    PROG      256      40    1
AMORT     PROG      256      18    2
POLY      PROG      256      29    3
SIMUL     PROG      256      47    4
ROOTS     PROG      256      19    5
```



Now, let's load the calendar program from the tape.

Type: (REW LOAD) "CALEND"
Press: (END LINE)

The display will now be blank and the light on the tape transport will be lit. When the light goes out and the display is turned on, the calendar program will be loaded. This program will remain in the machine until you load another program, SCRATCH it, or turn the computer off.

Program Operation Hints

These programs have been designed to execute with a minimum amount of difficulty, but problems may occur which you can easily solve during program operation. There are four different types of errors or warnings that can occur while executing a program: input errors, math errors, tape errors and image format string errors.

The input errors include errors 43, 44, and 45. All of these errors will cause a message to be output followed by a new question mark as a prompt for the input. You should verify your mistake and then enter the corrected input. The programs will not proceed until the input is acceptable. There is a more complete discussion of INPUT in your Owner's Manual.

The second type of error which might occur is the math errors (1 through 13). With DEFAULT ON, the first eight errors listed in appendix E of your Owner's Manual cause a warning message to be output, but program execution will not be halted. The cause of these errors can usually be attributed to specific characteristics of your data and the type of calculations being performed. In most cases, there is no cause for alarm, but you should direct your attention to a possible problem. An example of such a case is found in the Standard Pac when the curve fitting program computes a curve fit to your data which has a value of 1 for the coefficient of determination, r^2. The computation of the F ratio results in a divide by zero, Warning 8.

The third type of error, tape errors (60 through 75) may be due to several different problems. Some of the most likely causes are the tape being write-protected, the wrong cartridge (or no cartridge) being inserted, a bad tape cartridge, or wrong data file name specification during program execution. Appendix E of your Owner's Manual should be consulted for a complete listing.

The fourth type of error is due to generalizing the output to anticipated data ranges. In many cases, the output has assumed ranges which may or may not be appropriate with your data. Adjusting the image format string for your data will solve this type of problem. You may also want to change the image string if you require more digits to the right of the decimal point.

Whenever a running program is interrupted from the keyboard by inadvertantly pressing a key, the system beeps. To continue program execution, press (CONT) .

These are the more common problems which may occur during program operation. Your Owner's Manual should be consulted if you need more assistance.

Notes

Moving Average

In a moving average, a specified number of data points are averaged. When there is a new piece of input data, the oldest piece of data is discarded to make room for the latest input. This replacement scheme makes the moving average a valuable tool in following trends. The fewer the number of data points in the average, the more trend sensitive the average becomes. With a larger number of data points, the moving average behaves more like a regular average and is less sensitive to short lived trends.

This program allows you to specify both the number of points for computing the moving average and the number of points to be retained for tape storage. Both these values can be up to 200. You must specify these values first by pressing KEY #1 (#AV/#R) and entering them when requested. After this step, data can either be entered from the keyboard or optionally from an existing data file. The current moving average can be obtained after entering data by pressing KEY #3 (AVERAGE). The data entry prompt also displays the current moving average. This average is based on either the number of points entered or the number or points in the average specified before data entry, whichever is smaller. The data can be printed, plotted, or stored by pressing the specific key.

In many applications, moving averages are calculated daily, weekly, monthly, or even yearly. In such cases, it is necessary to store the retained data on a data file for future use. To do this, you only have to press KEY #4 (STORE) and then enter the file name. When this data is required again, specify the entry of data from the tape in the ENTER operation and then enter the name of the data file.

The data is stored in an array which is automatically updated as data is entered. For a more detailed explanation of the data structure used in the program, refer to the discussion in the appendix about this program.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "MOVING"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 4.

   OR:
   a. Press: KEY #1 (#AV#R), to enter the number of points in the average and the number of points to be retained.
   b. Go to step 5.
5. When NUMBER OF POINTS IN AVERAGE? is displayed:
   a. Enter: The number of points in the moving average.

b. Press: END LINE

Note: If RE-ENTER is displayed, the number of points is out of range (1,200). Go to step 5.

6. When NUMBER OF POINTS TO BE RETAINED? is displayed:
   a. Enter: The number of points to be retained before replacing old values with new values.
   b. Press: END LINE

   Note: If RE-ENTER is displayed, the number of points is out of range (# points in average, 200). Go to step 6.
7. To enter data after specifying the number of points in the average and number of points to be retained:
   a. Press: KEY #2 (ENTER)
   b. When OLD OR NEW DATA:O/N? is displayed:
      1) Enter: O, if the data is stored on a data file.
      2) Press: END LINE
      3) Go to step 8.

      OR:

      1) Enter: N, if the data is to be entered from the keyboard.
      2) Press: END LINE
      3) Go to step 9.

   Note: You must enter either "O" or "N" or the program will beep and go to step 7b.
8. When ENTER FILE NAME? is displayed:
   a. Enter: The name of the data file.
   b. Press: END LINE
   c. Go to step 10.

   Note: If FILE NAME-TOO LONG" or _IS NOT ON TAPE! is displayed, go to step 8.
9. When AVE.=_:VALUE,INF TO END? is displayed:
   a. Enter: The next value.
   b. Press: END LINE

   OR:

   a. Enter: INF to designate that there are no more entries.
   b. Press: END LINE
   c. Go to step 11.
10. When MORE ENTRIES:Y/N? is displayed:
    a. Enter: Y, if there are more values.
    b. Press: END LINE
    c. Go to step 9.

    OR:

    a. Enter: N, if there are no more values.
    b. Press: END LINE
11. After entering the data and specifying the number of points for the average and for retention, the following operations can be selected in any order:
    a. Press: KEY #3 (AVERAGE), to print the current moving average.
    b. Go to step 11 after the average is printed.

    OR:

    a. Press: KEY #4 (STORE), to store the array of retained values.
    b. Go to step 12.

    OR:

    a. Press: KEY #7 (VALUES), to print the retained values in order of most recent first.
    b. Go to step 11 after the values are printed.

    OR:

    a. Press: KEY #8 (PLOT), to plot the data and the moving average.
    b. Go to step 13.
12. When ENTER NAME OF FILE? is displayed:
    a. Enter: The name of the data file.
    b. Press: END LINE
    c. Go to step 11 after the data is stored.
13. When DO YOU WANT AVERAGES PRINTED? is displayed:

a. Enter: Y, if the moving averages are to be printed.
b. Press: END LINE

OR:

a. Enter: N, if the averages are not to be printed.
b. Press: END LINE

Note: You must enter either "Y" or "N" or the program will beep and go to step 13.

14. If a plot has already been done and NEW PLOT: Y/N? is displayed:
    a. Enter: Y, if the old plot is to be erased before this plot.
    b. Press: END LINE

    OR:

    a. Enter: N, if the existing plot is not to be erased before this plot.
    b. Press: END LINE
    c. Go to step 23.
15. When VERTICAL/HORIZONTAL LABELS: V/H? is displayed:
    a. Enter: V, if the X-axis labels are to be written vertically.
    b. Press: END LINE

    OR:

    a. Enter: H, if the X-axis labels are to be written horizontally.
    b. Press: END LINE

    Note: You must enter either "V" or "H" or the program will beep and go to step 15.
16. If the number of retained values is greater than 17 and
    NO. OF RETAINED
    VALUES =_
    NO. OF X-AXIS INTERVALS
    (<=16)? is displayed:
    a. Enter: The number of X intervals (<=16).
    b. Press: END LINE

    OR:

    a. Enter: The number of points between X-axis intervals preceded by a minus sign, e.g., -3, for tics at 1, 4, 7, 10, etc.
    b. Press: END LINE

    Note: The number of intervals must be less than or equal to 16 or the program will beep and go to step 16.

    Note: If there are fewer than 18 retained points, the program automatically sets the number of intervals to the number of retained points minus one.
17. When NUMBER X-INT. BETWEEN LABELS? is displayed:
    a. Enter: The number of X-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.
    b. Press: END LINE

    OR:

    a. Enter: 0, if no labels are desired on the X-axis.
    b. Press: END LINE

    Note: If the number of intervals is not in the range of 0 to the entered number of X-intervals, the program will beep and go to step 17.
18. When AUTO Y-SCALING: Y/N? is displayed:
    a. Enter: Y, if the Y-minimum and Y-maximum values are to be used by the program.
    b. Press: END LINE
    c. Go to step 21.

    OR:

    a. Enter: N, if you want to enter the Y-minimum and Y-maximum values.
    b. Press: END LINE

    Note: By specifying the end points you can have better control of the axis labels.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 18.
19. When ENTER SCALE YMIN? is displayed:

a. Enter: The minimum Y value for scaling.
b. Press: END LINE

20. When ENTER SCALE YMAX? is displayed:
a. Enter: The maximum Y value for scaling.
b. Press: END LINE

Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 19.

21. When NO. OF Y-AXIS INTERVALS:(<=12)? is displayed:
a. Enter: The number of Y-axis intervals (<=12).
b. Press: END LINE

Note: If the number of intervals is not in the range of 1 to 12, the program will beep and go to step 21.

22. When NUMBER OF Y-INT. BETWEEN LABELS? is displayed:
a. Enter: The number of Y-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.
b. Press: END LINE

OR:

a. Enter: 0, if no labels are desired on the Y-axis.
b. Press: END LINE

Note: If the number of intervals is not in the range of 0 to the entered number of Y-intervals, the program will beep and go to step 22.

23. When LABEL PLOT:Y/N? is displayed:
a. Enter: Y, if you want to label the plot.
b. Press: END LINE
c. Go to step 24.

OR:

a. Enter: N, if no label is desired.
b. Press: END LINE
c. Go to step 27.

Note: You must enter either "Y" or "N" or the program will beep and go to step 23.

24. When LABEL ORIGIN:X,Y? is displayed:
a. Enter: The X and Y coordinates where the label is to start.
b. Press: END LINE

Note: If INVALID POSITION is displayed, the entered coordinates are out of the scale limits and the program goes to step 24.

Note: To aid label positioning the following variables may be useful to use.

Variable Name	Description
X0	Minimum X-scaled value
Y0	Minimum Y-scaled value
*	X-value at axes intercept is 1
M1	Y-value at axes intercept
M3	X-value at right end of X-axis
M2	Y-value at top end of Y-axis
Z1	M3—1
Z2	M2—M1
D1	Distance of a dot in X-direction
D2	Distance of a dot in Y-direction

25. When ENTER LABEL? is displayed:
a. Enter: The label.
b. Press: END LINE

Note: If LABEL TOO LONG is displayed, the program beeps and goes to step 25.

26. After the label has been drawn, go to step 23.
27. When CHANGE NUMBER OF POINTS:Y/N? is displayed:
a. Enter: Y, if you want to change the number of points.
b. Press: END LINE
c. Go to step 28.

OR:

a. Enter: N, if you do not want to change the number of points.
b. Press: END LINE
c. Go to step 11.

28. When ENTER NO. OF POINTS IN AVERAGE is displayed:
    a. Enter: The number of points in the average.
    b. Press: END LINE
    c. Go to step 13.

Example 1:

A five period moving average is used to study the trends in a stock's price. The closing price for the first ten days are as follows:

Day	1	2	3	4	5	6	7	8	9	10
Closing Price	55	54-1/8	54-1/2	54-1/2	55	56	55-1/2	56	57	59

Compute the moving average after specifying a five-period moving average and retaining values for 100 periods. After entering the ten values, plot the moving averages and store the retained values in file "STOCK".

To duplicate the example, use 3 intervals between labels on the X-axis, 50 as the Y-minimum, 60 as the Y-maximum, and 1 interval between labels on the Y-axis. To position the label, use 1.5 and 51 as the X and Y values respectively.

Notes

Annuities and Compound Amounts with Amortization

This program can be used to solve a variety of problems involving money, time and interest. The following variables can be inputs or outputs:

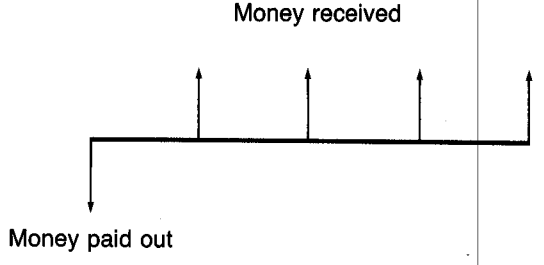
n,	which is the number of compounding periods. (For a 30 year loan with monthly payments, $n = 12 \times 30 = 360$).
i,	which is the annual interest rate expressed as a percent.
PMT,	which is the periodic payment.
PV,	which is the present value of the cash flows or compound amounts.
FV,	which is the future value of a compounded amount or a series of cash flows.

The program accommodates payments which are made at the end of compounding periods or at the beginning. Payments made at the end of compounding periods (ordinary annuity) are common in direct reduction loans and mortgages while payments at the beginning of compounding periods (annuity due) are common in leasing.

Calculations are made in either mode by pressing the KEY #7 (SLV/AD) once for ordinary annuity or twice for annuity due before pressing the key for the unknown variable.

After entering or solving for the necessary values, an ordinary annuity amortization schedule can be obtained for a user specified number of periods by pressing the KEY #6 (AMORT).

A cash flow diagram enables you to describe a compound interest problem in terms that the computer can understand. Once you draw and label your diagram, you simply key in the known data when requested and solve for the unknown value.



Instead of "What is my problem?" ask yourself, "What are the cash flows?"

Solving for any of the values (*n, i, PV, PMT,* or *FV)* is easy with your computer. There are four simple rules to remember—rules that are the same for all compound interest calculations.

1. Given three or four of the financial values *(n, i, PV, PMT,* or *FV),* you can solve for the fourth and/or fifth values, as long as *n* and/or *i* are known.* Both *n* and *i* are involved in all financial calculations. You can enter the values in any order.

2. Use the cash flow sign convention throughout all compound interest calculations (including amortization): *Cash received (arrow pointing up) is represented by a positive value (+). Cash paid out (arrow pointing down) is represented by a negative value (−).*
3. Whenever payments *(PMT)* are involved, it is always necessary to specify whether the payments are made at the beginning of the payment period or whether the payments are made at the end of the payment period. Pressing KEY #7 once for ordinary annuity (payments at end) or twice for annuity due.
4. Remember that n and i must correspond to the same time frame, i.e., the number of compounding periods.

This convention was first introduced on the HP-92 and is designed to decrease the ambiguity involved with financial calculations of this type.

Equations:

$$PV + (1+i)^{\delta}\, PMT\, \frac{1-(1+i)^{-n}}{i} + FV\,(1+i)^{-n} = 0$$

$$\text{where } \delta = \begin{matrix} 0 \text{ ordinary annuity} \\ 1 \text{ annuity due} \end{matrix}$$

The equation above is solved for i using Newton's method where:

$$i_n = i_{n-1} - \frac{f(i_{n-1})}{f'(i_{n-1})}$$

This is why solutions involving i take longer than other solutions.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "AMORT"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When PRINTER OUTPUT:Y/N? is displayed:
   a. Enter: Y, if the results are to be printed.
   b. Press: (END LINE)

   OR:

   a. Enter: N, if the results are not to be printed.
   b. Press: (END LINE)

   Note: You must enter either "Y" or "N" or the program will beep and go to step 4.
5. When the keys are labelled and SELECT OPTION is displayed:
   a. Go to step 6 and enter known values.

   OR:

   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. Go to step 6.
6. To enter the known values:

   n:

   a. Press: KEY #1 (n) to enter the number of periods.

* The computer uses all four variables to solve for the fifth. Zero is assigned to those values that have not been computed or entered since the computer was last cleared.

b. When ENTER # OF COMPOUNDING PERIODS? is displayed:
   1) Enter: The number of compounding periods.
   2) Press: (END LINE)
   3) Go to step 6.

i:

a. Press: KEY #2 (i) to enter the periodic interest rate.
b. When ENTER ANNUAL % RATE? is displayed:
   1) Enter: The annual % rate, e.g., 10% would be entered as 10 not .10.
   2) Press: (END LINE)
c. When ENTER # OF COMPOUNDING PERIODS/YR? is displayed:
   1) Enter: The number of compounding periods per year.
   2) Press: (END LINE)
   3) Go to step 6.

PV:

a. Press: KEY #3 (PV) to enter the present value.
b. When ENTER PRESENT VALUE? is displayed:
   1) Enter: The present value.
   2) Press: (END LINE)
   3) Go to step 6.

PMT:

a. Press: KEY #4 (PMT) to enter the periodic payment.
b. When ENTER PERIODIC PAYMENT? is displayed:
   1) Enter: The periodic payment.
   2) Press: (END LINE)
   3) Go to step 6.

FV:

a. Press: KEY #8 (FV) to enter the future value.
b. When ENTER FUTURE VALUE? is displayed:
   1) Enter: The future value.
   2) Press: (END LINE)
   3) Go to step 6.

7. To solve for an unknown value:
   a. Press: KEY #7 (SLV/AD) to specify ordinary annuity.
   b. Press: The KEY designating the unknown (KEY #1, 2, 3, 4, or 8).

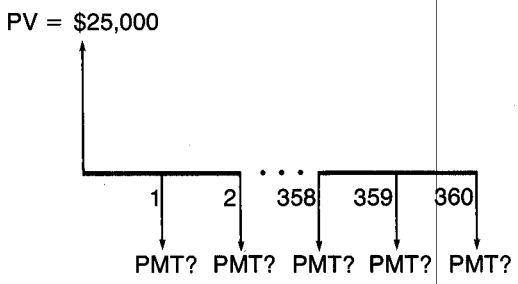
   OR:

   a. Press: KEY #7 (SLV/AD) twice to specify annuity due.
   b. Press: The KEY designating the unknown (KEY #1, 2, 3, 4, or 8).
8. To change values go to step 6.
9. To obtain an amortization schedule:
   a. Press: KEY #6 (AMORT)
   b. When ENTER STARTING PERIOD? is displayed:
      1) Enter: The starting period number.
      2) Press: (END LINE)
   c. When ENTER ENDING PERIOD? is displayed:
      1) Enter: The ending period number.
      2) Press: (END LINE)
   d. After the amortization schedule is printed go to step 6.

Note: If INSUFFICIENT DATA is displayed, you must enter or solve for all five values. Future value *(FV)* is assumed to be zero unless set to another value.

Example 1:

What is the monthly payment required to fully amortize a 30 year, $25,000 mortgage if the annual percentage rate is 10-1/4%? After solving the problem, generate an amortization schedule for the first 12 periods.



```
PERIODIC PAYMENT = -224.03

AMORTIZATION
n =  360.00
i =10.25%
PAYMENT =$ -224.03
PRESENT VALUE =$  25000.00
FUTURE VALUE =$      0.00
 P  PRINCIPAL  INTEREST  BALANCE
 1      10.49    213.54  24989.51

Example 2:

A construction firm owns some equipment worth $15,000. They intend to lease this equipment to another firm for 9 years with monthly payments in advance of $250.00. The equipment is assumed to have no salvage value at the end of the lease. What yield rate does this represent?

```
PERIODIC INTEREST RATE =   1.24%
```

Polynomial Solutions

This program may be used to find the roots, Z, of polynomials of the form:

$$a_0 + ib_0 + (a_1 + ib_1)\, Z + (a_2 + ib_2)\, Z^2 + \ldots + (a_n + ib_n)\, Z^n = 0$$

You must initially enter the complex coefficients of the polynomial and its degree. Tolerances for the root and for functional evaluations and the maximum number of iterations are also needed. After entry of data, you can edit and print the polynomial before roots are found.

The roots are found by expressing the polynomials in terms of Siljak functions and using the method of steepest descent to determine the zeros.

Once a root is found, the polynomial is reduced by synthetic division and the process is repeated. The last root is computed algebraically. The algorithm is very accurate and stable; it will virtually always find the roots and you are not required to provide an initial value. Multiple roots are found at some slightly reduced accuracy, and higher order polynomials may show some loss of accuracy as more roots are found. In general, the program will find "normally" spaced roots accurate to better than 6 decimal places. Newton's method could find the roots faster, but convergence is not guaranteed and with Siljak's method, no a priori information such as the derivative is necessary.

$$F(Z) = \sum_{k=0}^{n} (a_k + ib_k)\, Z^k = 0$$

Siljak Functions X_k and Y_k are defined by $Z^k = X_k + iY_k$ and may be calculated recursively

$$X_0 = 1, X_1 = .1, Y_0 = 0, Y_1 = 1$$

$$X_{k+2} = 2x\, X_{k+1} - (x^2 + y^2)\, X_k$$

where $x+iy$ are the root approximations

$$Y_{k+2} = 2x\, Y_{k+1} - (x^2 + y^2)\, Y_k$$

$$u = \sum_{k=0}^{n} (a_k X_k - b_k Y_k) \qquad \frac{\delta u}{\delta x} = \sum_{k=1}^{n} k\, (a_k X_{k-1} - b_k Y_{k-1})$$

$$v = \sum_{k=0}^{n} (a_k Y_k + b_k X_k) \qquad \frac{\delta v}{\delta x} = \sum_{k=1}^{n} k\, (a_k Y_{k-1} + b_k X_{k-1})$$

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "POLY"
   b. Press: (END LINE)
3. To run the program:
   Press: (RUN)
4. When SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation has been displayed, go to step 4.

   OR:

   a. Press: KEY #1 (ENTER), to enter the coefficients.
   b. Go to step 5.
5. When DEGREE OF POLYNOMIAL? is displayed:
   a. Enter: The degree of the polynomial.
   b. Press: (END LINE)
6. When MAX # OF ITERATIONS? is displayed:
   a. Enter: The maximum number of iterations allowed per root.
   b. Press: (END LINE)
7. When TOLERANCE FOR ROOTS? is displayed:
   a. Enter: The tolerance desired for the roots; a root is accepted if the difference in value of the root approximations of two successive iterations is less than this tolerance.
   b. Press: (END LINE)
8. When TOLERANCE FOR FUNCTIONAL EVAL.? is displayed:
   a. Enter: The tolerance for the functional evaluations; a root x is accepted if $|F(x)| \leq$ this tolerance.
   b. Press: (END LINE)
9. When Rcoef(_)=? is displayed:
   a. Enter: The appropriate real part of the coefficient; each subscript corresponds to the exponent of the variable; i.e., $(a_0 + b_0 i) + (a_1 + b_1 i) Z^1 + (a_2 + b_2 i) Z^2 + \ldots + (a_n + b_n i) Z^n$.
   b. Press: (END LINE)
10. When Icoef(_)=? is displayed:
    a. Enter: The appropriate imaginary part of the coefficient as in step 9.
    b. Press: (END LINE)
11. Repeat steps 9 and 10 for each coefficient to the degree of the polynomial.
12. Once the data has been entered:
    a. Press: KEY #2 (EDIT), to change a coefficient.
    b. Go to step 13.

    OR:

    a. Press: KEY #3 (PRINT), to print the polynomial.
    b. Go to step 12 after the printout is finished.

    OR:

    a. Press: KEY #4 (ROOTS), to compute the roots of the polynomial.
    b. Go to step 12 after the real and imaginary parts of the roots are printed.

    Note: Any roots not found will contain 9.999999 E 499.
13. When COEFFICIENT NUMBER? is displayed:
    a. Enter: The number of the coefficient to be changed.
    b. Press: (END LINE)

    Note: If the coefficient number is out of range, go to step 13.
14. When Rcoef(I)? (Where I is the number of the coefficient to be changed) is displayed:
    a. Enter: The new value of Rcoef(I).
    b. Press: (END LINE)

15. When `Icoef(I)?` (Where I is the number of the coefficient to be changed) is displayed:
    a. Enter: The new value of Icoef(I).
    b. Press: END LINE
    c. Go to step 12.

Example 1:

A ball is thrown straight up at a velocity of 15 meters per second, from a balcony 10 meters off the ground. At what time, neglecting air resistance, will it reach the ground? The acceleration due to gravity is 9.81 meters per second per second. From physics:

$$F(t) = x = x_0 + v_0 t + 1/2\, a\, t^2$$

$$x = 0$$
$$x_0 = 10$$
$$v_0 = 15$$
$$a = -9.81$$

The polynomial for this problem is:

$$10 + 15\, t + (-9.81/2)\, t^2 = 0$$

The maximum number of iterations should be 20, the tolerance for roots should be 1E − 8, and the tolerance for functional evaluation should be 1E − 6.

Simultaneous Equations

The program allows you to input and solve a system of simultaneous linear equations. You are asked to enter the number of equations you have to solve (the number of equations to be solved is equal to the number of independent variables). The program is designed to handle up to 20 equations. Once the coefficients have been entered, you have the option of editing or printing the equations before solving them. After solving the system of equations, you can then edit the current set of data or enter a new system of equations to be solved.

The method used to solve the system of equations is a modified Gauss-Jordan method with maximum pivot strategy.* If the system of equations has no solution, SYSTEM HAS NO SOLUTION will be printed.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "SIMUL"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 4.
   OR:
   a. Press: KEY #1 (ENTER), to enter the system of equations.
   b. Go to step 5.
5. When ENTER NUMBER OF EQUATIONS? is displayed:
   a. Enter: The number of equations to be solved.
   b. Press: (END LINE)
6. When ENTER COEFF FOR ELEMENT #_,_? is displayed:
   a. Enter: The jth coefficient of the ith equation.
   b. Press: (END LINE)
7. Repeat step 6 for each coefficient of the ith equation.
8. When ENTER THE RHS OF EQUATION #_? is displayed:
   a. Enter: The right-hand side of the ith equation.
   b. Press: (END LINE)
9. Repeat steps 6-8 for each of the equations in the system.
10. When the system of equations has been entered:
    a. Press: KEY #2 (EDIT), to edit the system of equations.
    b. Go to step 11.
    OR:
    a. Press: KEY #3 (SOLVE), to solve the system of equations.
    b. Go to step 16.

* Applied Numerical Methods—Carnahan, Luther & Wilkes, John Wiley & Sons, NY, 1969—p. 291, 292.

OR:

a. Press: KEY #4 (PRINT), to print out the system of equations.
b. After the printout, go to step 10.

11. When WHICH EQUATION? is displayed:
    a. Enter: The equation number of the equation which needs to be changed.
    b. Press: END LINE
12. When WHICH SIDE: L/R? is displayed:
    a. Enter: L, if you want to change the left-hand side of the equation.
    b. Press: END LINE
    c. Go to step 13.

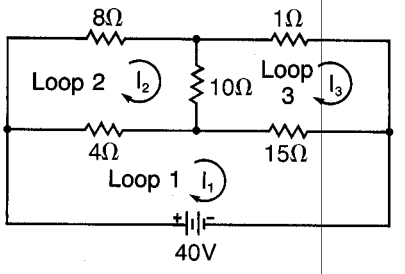
    OR:

    a. Enter: R, if you want to change the right-hand side of the equation.
    b. Press: END LINE
    c. Go to step 15.

    Note: You must enter either "L" or "R" or the program will beep and go to step 12.
13. When WHICH COEFFICIENT IS WRONG? is displayed:
    a. Enter: The subscript of the faulty coefficient.
    b. Press: END LINE
14. When ENTER COEFF FOR ELEMENT #_,_? is displayed:
    a. Enter: The new *j*th coefficient of the *i*th equation.
    b. Press: END LINE
    c. Go to step 10.
15. When ENTER THE RHS OF EQ. #_? is displayed:
    a. Enter: The new right-hand side of the *i*th equation.
    b. Press: END LINE
    c. Go to step 10.
16. When ENTER EPSILON? is displayed:
    a. Enter: The minimum value for a pivot value.
    b. Press: END LINE
    c. After the solution (if it exists) and an absolute error vector have been printed, go to step 4 to enter a new system of equations, or to step 10 to continue working with this system of equations.

Example 1:

Solve for the loop currents in the following circuit.



The three loops are:

LOOP 1: $4I_1 - 4I_2 + 15I_1 - 15I_3 - 40 = 0$
LOOP 2: $4I_2 - 4I_1 + 8I_2 + 10I_2 - 10I_3 = 0$
LOOP 3: $10I_3 - 10I_2 + 1I_3 + 15I_3 - 15I_1 = 0$

or:

$19I_1 - 4I_2 - 15I_3 - 40 = 0$
$-4I_1 + 22I_2 - 10I_3 = 0$
$-15I_1 - 10I_2 + 26I_3 = 0$

Epsilon should be 1E − 6

```
SYSTEM OF EQUATIONS:
Equation #1:    19*X(1) + -4*X(2)
 + -15*X(3)=40
Equation #2:    -4*X(1) + 22*X(2)
 + -10*X(3)=0
Equation #3:    -15*X(1) +
-10*X(2) + 26*X(3)=0

    SOLUTION          ABSOLUTE ERROR
X(  1)=      7.8601     1.0000E-010
X(  2)=      4.2298     2.0000E-010
X(  3)=      6.1615     0.0000E+000
```

Example 2:

Solve the following system of simultaneous equations:

Equation #1: $1 \cdot X(1) + 5 \cdot X(2) + 4 \cdot X(3) + 3 \cdot X(4) + 8 \cdot X(5) = 6$
Equation #2: $7 \cdot X(1) + 8 \cdot X(2) + 5 \cdot X(3) + 4 \cdot X(4) + 8 \cdot X(5) = 9$
Equation #3: $2 \cdot X(1) + 0 \cdot X(2) + 4 \cdot X(3) + 7 \cdot X(4) + 3 \cdot X(5) = 6$
Equation #4: $7 \cdot X(1) + 4 \cdot X(2) + 8 \cdot X(3) + 5 \cdot X(4) + 1 \cdot X(5) = 3$
Equation #5: $1 \cdot X(1) + 2 \cdot X(2) + 2 \cdot X(3) + 4 \cdot X(4) + 0 \cdot X(5) = 0$

Epsilon should be 1E − 6

```
SYSTEM OF EQUATIONS:
Equation #1:    1*X(1) + 5*X(2)
 + 4*X(3) + 3*X(4) + 8*X(5)=6
Equation #2:    7*X(1) + 8*X(2)
 + 5*X(3) + 4*X(4) + 8*X(5)=9
Equation #3:    2*X(1) + 0*X(2)
 + 4*X(3) + 7*X(4) + 3*X(5)=6
Equation #6:    7*X(1) + 4*X(2)
 + 8*X(3) + 5*X(4) + 1*X(5)=3
Equation #5:    1*X(1) + 2*X(2)
 + 2*X(3) + 4*X(4) + 0*X(5)=0

    SOLUTION          ABSOLUTE ERROR
X(  1)=       .8661    -3.0000E-011
X(  2)=      -.7171    -3.0000E-011
X(  3)=      -.3741    -2.0000E-011
X(  4)=       .3291    -1.0000E-011
X(  5)=      1.1536     0.0000E+000
```

Notes

Calculus and Roots of f(x)

This program incorporates four routines for numerical analysis of user specified functions. Suppose figure 1 represents a known function of x called $f(x)$.

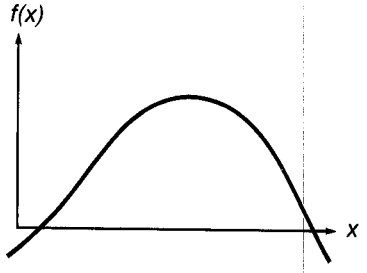


Figure 1

If the formula for $f(x)$ can be entered as a function FNF starting at line 5000, this program can be used to find the value of $f(x)$ at any point x, the derivative of $f(x)$ at any point x, the integral of $f(x)$ over a specified interval and the real roots of $f(x)$.

Once a function has been entered, any of the four routines can be selected. By pressing KEY #4 and entering a value of x, the value of $f(x)$ will be calculated (see figure 2).

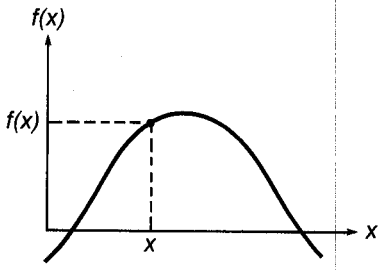

Figure 2

Similarly, the value of the slope of $f(x)$ at a particular point x can be calculated by pressing KEY #1 and entering a value of x (see figure 3). The slope of $f(x)$ is determined using an approximation to the differential:

$$f'(x) = \frac{f(x + \Delta x/2) - f(x - \Delta x/2)}{\Delta x}$$

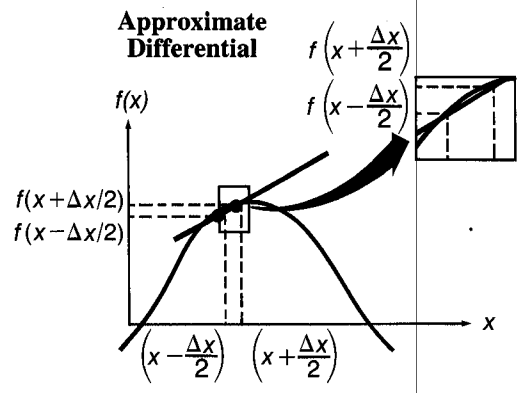

Figure 3

The value of x used to approximate the differential is assumed to be 0.01% of $x(10^{-4} \times x)$ unless a %Δ is specified by the user. That is:

$$\Delta x = \frac{\%\Delta}{100} \cdot x$$

In the special case where $x=0$, x is set equal to %Δ.

For most applications, the assumed value of 0.01% should be adequate. In some cases more accurate results can be obtained using a smaller value of %Δ. However, care must be taken to assure that the computer can accurately resolve the difference between $f(x - \Delta x/2)$ and $f(x + \Delta x/2)$.

The KEY #2 can be used to approximate $\int_a^b f(x)dx$ for the user-defined function $f(x)$. The function must be continuous over the interval $[a,b]$.

The method used is Simpson's one-third rule with truncation error $0(h^4)$ where h is the interval size.

The stopping criterion for this method is either a maximum number of interval halvings or successive computations of the integral differing by less than some user-supplied error tolerance.

Simpson's one-third rule:

$$\int_a^b f(x)dx = \frac{h}{3}\left[f(a) + 4f(a+h) + 2f(a+2h) + 4f(a+3h) + \ldots + 4f(a+(n-1)h) + f(a+nh)\right]$$

where n = *number of intervals*,

$$h = \frac{(b-a)}{n} = \textit{interval size}.$$

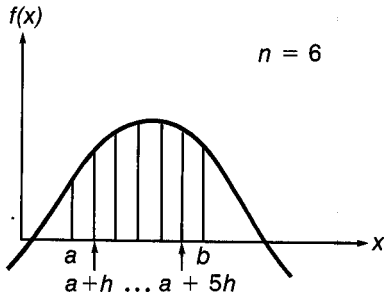

Figure 4

You can search for solutions of $f(x)=0$ over an interval $[a,b]$ by using KEY #3. After you specify the search increment Δx and the error tolerance for $f(x)$, the program then begins at the left of the interval and compares functional values at the ends of the subinterval $[a,a+\Delta x]$. If the functional values are of opposite sign then the bisection method is used to locate the root. Each subinterval $[a+ix,a+(i+1)\Delta x]$ is examined for a possible root. At most one root per interval will be located and if there are multiple roots per interval, none may be located. You must also specify a maximum number of interval-halvings, Maxbi, so that an error tolerance that is not satisfied will result in the root localized to an interval of size $2^{-\text{Maxbi}}(b-a)$. The subprogram will examine $N = int\left(\frac{b-a}{\Delta x}\right)$ intervals.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "ROOTS"
   b. Press: (END LINE)
3. Type the function, FNF, to be analyzed starting at line 5000.

   Note: Make sure that any lines after line 5000 which are not in your function are deleted before running the program.
4. To run program:
   a. Press: (RUN)
5. When the keys are labelled and IS FUNCTION STORED: Y/N? is displayed:
   a. Enter: Y, if the function is stored at line 5000.
   b. Press: (END LINE)
   c. Go to step 6.

   OR:

   a. Enter: N, if the function is not stored.
   b. Press: (END LINE)
   c. Go to step 3.

   Note: You must enter either "Y" or "N" or the program will beep and go to step 5.
6. When SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP) if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 6.

   OR:

   a. Press: KEY #1 (f'(x)) to compute the derivative of $f(x)$ at an entered value of x.
   b. Go to step 7.

   OR:

   a. Press: KEY #2 (INTEG) to compute the integral of $f(x)$ over an interval using Simpson's rule.
   b. Go to step 10.

   OR:

   a. Press: KEY #3 (ROOT) to search for solutions to $f(x)=0$ over an interval.
   b. Go to step 17.

   OR:

   a. Press: KEY #4 (f(x)) to compute the value of the function for an entered value of x.
   b. Go to step 25.
7. When ENTER VALUE OF X? is displayed:
   a. Enter: The value of x for calculating the derivative.
   b. Press: (END LINE)
8. When ENTER %Δ? is displayed:
   a. Enter: The %Δ.
   b. Press: (END LINE)

   OR:

   a. Enter: 0 if the default of .01% is to be used as the %Δ.
   b. Press: (END LINE)
9. After the differential is printed, go to step 6.
10. When ENTER LOWER BOUND? is displayed:
    a. Enter: The lower bound.
    b. Press: (END LINE)
11. When ENTER UPPER BOUND? is displayed:
    a. Enter: The upper bound.
    b. Press: (END LINE)
12. When PRINT INTERMEDIATE POINTS: Y/N? is displayed:
    a. Enter: Y, if the value of the integral is to be printed after every interval halving.
    b. Press: (END LINE)

    OR:

    a. Enter: N, if only the final value is to be printed.
    b. Press: (END LINE)

13. When MAX # OF INTERVAL HALVINGS? is displayed:
    a. Enter: The maximum number of interval halvings. The evaluation of the integral will be made on 2 subintervals, the 4, 16, 32, ..., halving the interval size on each iteration.
    b. Press (END LINE)
14. When ERROR TOLERANCE? is displayed:
    a. Enter: The error tolerance. The value of the integral is accepted if the difference in value of two successive approximations is less than this tolerance.
    b. Press: (END LINE)
15. If ERROR IN DATA is printed, go to step 10.
16. After the integral is printed, go to step 6.
17. When ENTER LOWER BOUND? is displayed:
    a. Enter: The lower bound.
    b. Press: (END LINE)
18. When ENTER UPPER BOUND? is displayed:
    a. Enter: The upper bound.
    b. Press: (END LINE)
19. When ENTER MAXIMUM # OF BISECTIONS? is displayed:
    a. Enter: The maximum number of bisections allowed in searching for any one root in a subinterval.
    b. Press: (END LINE)
20. When ERROR TOLERANCE? is displayed:
    a. Enter: The error tolerance desired.
    b. Press: (END LINE)
21. When ENTER SEARCH INCREMENT? is displayed:
    a. Enter: The search increment.
    b. Press: (END LINE)
22. When ENTER # OF ROOTS? is displayed:
    a. Enter: The number of roots to be found.
    b. Press: (END LINE)
23. If ERROR IN DATA is printed, go to step 17.
24. After the roots are printed, go to step 6.
25. When ENTER VALUE OF X? is displayed:
    a. Enter: The value of x.
    b. Press: (END LINE)
26. After the function value of x is printed, go to step 6.

Example 1:

Numerical integration provides the only solution to the complete elliptic integral of the first kind:

$$u = \int_0^{\pi/2} \frac{d\theta}{\sqrt{(1 - k^2 \sin \theta^2)}}$$

Find the value of u for limits of integration of 0.0 to $\pi/2$. Let K be 0.5. The function should be stored at line 5000 as shown:

```
5000 DEF FNF(X) = 1/SQR (1 - .25 * SIN(X) * SIN(X))
```

The intermediate results should be printed. You should enter a maximum number of interval halvings of 10 and an error tolerance of 1E − 6. After finding the integral, determine the value of the function at $\pi/4$.

 VALUE OF F(X) IS          1.069
```

Example 2:

Find the root of $\ln x - 2x + 5.2249 = 0$ in the range of 1 to 5 using a maximum of 20 bisections, an error tolerance of 1E − 6, and a search increment of .1. After finding the root, determine the slope at the root. Use the default %Δ of .01%. The function should be stored as line 5000 as shown:

```
5000 DEF FNF(X)=LOG(X)-2*X+5.2249
```

```

Curve Fitting

This program can be used to fit data to:

1. Straight lines (linear regression); $y = a - bx$.
2. Exponential curves; $y = ae^{bx}$ $(a>0)$,
3. Logarithmic curves; $y = a + b\ln x$,
4. Power Curves; $y = ax^b$ $(a>0)$.

The type of curve fit is specified after data is entered. Any curve can be specified by pressing the desired key.

The data is entered initially from the keyboard, but can then be stored on the tape for later use and updating. The program is designed for a maximum of 200 data pairs. The data which has been entered can then be edited and printed.

Once the curve fit has been selected, the regression values will be calculated. The coefficient of determination, r^2, indicates the quality of fit achieved by the regression. Values of r^2 close to 1.00 indicate a better fit than values close to zero. The regression coefficients, a and b, define the curve generated, according to the equations shown above.

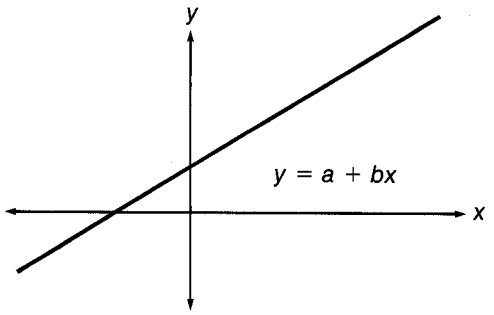
After the analysis of variance has been calculated and printed, you can plot the regression line over the data. Projections can also be made based on the curve fit. You can either enter single values of x or request that all values of x in the data set be used to estimate values of y, $\hat{y}$.

The analysis of variance which is printed for each regression type prints the following values:

1. Degrees of freedom
2. Sum of squares
3. Mean sum
4. F-ratio
5. r^2

The value of the F-ratio is set to 999.9 if it is greater than 999.9. Therefore if the r^2 value is close or equal to 1, the value of the F-ratio will be printed as 999.9.

Linear Regression

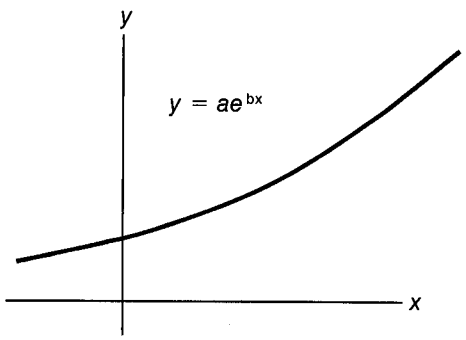


$$b = \frac{\Sigma x_i y_i - \frac{\Sigma x_i \, \Sigma y_i}{n}}{\Sigma x_i^2 - \frac{(\Sigma x_i)^2}{n}}$$

$$a = \left[\frac{\Sigma y_i}{n} - b \frac{\Sigma x_i}{n} \right]$$

$$r^2 = \frac{\left[\Sigma x_i y_i - \frac{\Sigma x_i \, \Sigma y_i}{n} \right]^2}{\left[\Sigma x_i^2 - \frac{(\Sigma x_i)^2}{n} \right] \left[\Sigma y_i^2 - \frac{(\Sigma y_i)^2}{n} \right]}$$

Exponential Curve Fit

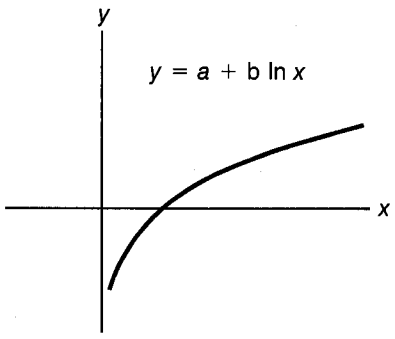


$$b = \frac{\Sigma x_i \ln y_i - \frac{1}{n} (\Sigma x_i)(\Sigma \ln y_i)}{\Sigma x_i^2 - \frac{1}{n} (\Sigma x_i)^2}$$

$$a = \exp \left[\frac{\Sigma \ln y_i}{n} - b \frac{\Sigma x_i}{n} \right]$$

$$r^2 = \frac{\left[\Sigma x_i \ln y_i - \frac{1}{n} \Sigma x_i \, \Sigma \ln y_i \right]^2}{\left[\Sigma x_i^2 - \frac{(\Sigma x_i)^2}{n} \right] \left[\Sigma (\ln y_i)^2 - \frac{(\Sigma \ln y_i)^2}{n} \right]}$$

Logarithmic Curve Fit

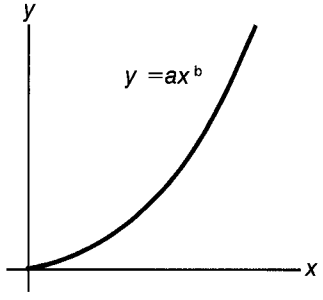


$$b = \frac{\Sigma y_i \ln x_i - \frac{1}{n} \Sigma \ln x_i \Sigma y_i}{\Sigma (\ln x_i)^2 - \frac{1}{n} (\Sigma \ln x_i)^2}$$

$$a = \frac{1}{n} (\Sigma y_i - b \Sigma \ln x_i)$$

$$r^2 = \frac{\left[\Sigma y_i \ln x_i - \frac{1}{n} \Sigma \ln x_i \Sigma y_i\right]^2}{\left[\Sigma (\ln x_i)^2 - \frac{1}{n} (\Sigma \ln x_i)^2\right]\left[\Sigma y_i^2 - \frac{1}{n} (\Sigma y_i)^2\right]}$$

Power Curve Fit



$$b = \frac{\Sigma (\ln x_i)(\ln y_i) - \frac{(\Sigma \ln x_i)(\Sigma \ln y_i)}{n}}{\Sigma (\ln x_i)^2 - \frac{(\Sigma \ln x_i)^2}{n}}$$

$$a = \exp\left[\frac{\Sigma \ln y_i}{n} - b \frac{\Sigma \ln x_i}{n}\right]$$

$$r^2 = \frac{\left[\Sigma (\ln x_i)(\ln y_i) - \frac{(\Sigma \ln x_i)(\Sigma \ln y_i)}{n}\right]^2}{\left[\Sigma (\ln x_i)^2 - \frac{(\Sigma \ln x_i)^2}{n}\right]\left[\Sigma (\ln y_i)^2 - \frac{(\Sigma \ln y_i)^2}{n}\right]}$$

Remarks:

Negative and zero values of x_i will cause a displayed error for logarithmic curve fits. Negative and zero values of y_i will cause a displayed error for exponential curve fits. For power curve fits both x_i and y_i must be positive, non-zero values.

As the differences between x and/or y values become small, the accuracy of the regression coefficients will decrease.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "CURVE"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 4.
   OR:
   a. Press: KEY #1 (ENTER), to enter the data pairs to be fit.
   b. Go to step 5.
5. When PRINT DATA ON INPUT: Y/N? is displayed:
   a. Enter: Y, if you want the data printed on entry.
   b. Press: (END LINE)
   OR:
   a. Enter: N, if you do not want the data printed on entry.
   b. Press: (END LINE)

   Note: You must enter either "Y" or "N" or the program will beep and go to step 5.
6. When ENTER FROM KEYBOARD/ TAPE: K/T? is displayed:
   a. Enter: K, if the data is to be entered from the keyboard.
   b. Press: (END LINE)
   c. Go to step 7.
   OR:
   a. Enter: T, if the data is to be entered from an existing data file.
   b. Press: (END LINE)
   c. Go to step 12.

   Note: You must enter either "K" or "T" or the program will beep and go to step 6.
7. When NO. OF POINTS? is displayed:
   a. Enter: The number of data pairs.
   b. Press: (END LINE)

   Note: The maximum number of pairs is 200.
8. If INVALID NUMBER OF POINTS is displayed, go to step 7 and reenter a valid number.
9. When X(_),Y(_)=? is displayed:
   a. Enter: The x and y values separated by a comma.
   b. Press: (END LINE)
10. Repeat step 9 for each pair.
11. When DATA ENTERED is displayed, go to step 13.
12. When ENTER FILE NAME? is displayed:
   a. Enter: The file name.
   b. Press: (END LINE)

   Note: If an error occurs during the load, the program returns to step 12.
13. When PLOT DATA: Y/N? is displayed:
   a. Enter: Y, if the data pairs are to be plotted.
   b. Press: (END LINE)
   c. Go to step 14.
   OR:
   a. Enter: N, if the data is not to be plotted.
   b. Press: (END LINE)
   c. Go to step 25.

   Note: You must enter either "Y" or "N" or the program will beep and go to step 13.
14. When AUTO X-SCALING: Y/N? is displayed:
   a. Enter: Y, if the X-minimum and X-

maximum values are to be used by the program.

b. Press: (END LINE)

c. Go to step 17.

OR:

a. Enter: N, if you want to enter the X-minimum and X-maximum values.

b. Press: (END LINE)

Note: By specifying the end points you can have better control of the axis labels.

Note: You must enter either "Y" or "N" or the program will beep and go to step 14.

15. When ENTER SCALE XMIN? is displayed:

a. Enter: The minimum X-value for scaling.

b. Press: (END LINE)

16. When ENTER SCALE XMAX? is displayed:

a. Enter: The maximum X value for scaling.

b. Press: (END LINE)

Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 15.

17. When VERTICAL/HORIZONTAL LABELS:V/H? is displayed:

a. Enter: V, if the X-axis labels are to be written vertically.

b. Press: (END LINE)

OR:

a. Enter: H, if the X-axis labels are to be written horizontally.

b. Press: (END LINE)

Note: You must enter either "V" or "H" or the program will beep and go to step 17.

18. When NO. OF X-AXIS INTERVALS: (<=16)? is displayed:

a. Enter: The number of X-axis intervals (≤16).

b. Press: (END LINE)

Note: If the number of intervals is not in the range of 1 to 16, the program will beep and go to step 18.

19. When NUMBER OF X-INT. BETWEEN LABELS? is displayed:

a. Enter: The number of X-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.

b. Press: (END LINE)

OR:

a. Enter: 0 if no labels are desired on the X-axis.

b. Press: (END LINE)

Note: If the number of intervals is not in the range of 0 to the entered number of X-intervals, the program will beep and go to step 19.

20. When AUTO Y-SCALING:Y/N? is displayed:

a. Enter: Y, if the Y-minimum and Y-maximum values are to be used by the program.

b. Press: (END LINE)

c. Go to step 23.

OR:

a. Enter: N, if you want to enter the Y-minimum and Y-maximum values.

b. Press: (END LINE)

Note: By specifying the end points you can have better control of the axis labels.

Note: You must enter either "Y" or "N" or the program will beep and go to step 20.

21. When ENTER SCALE YMIN? is displayed:

a. Enter: The minimum Y value of scaling.

b. Press: (END LINE)

22. When ENTER SCALE YMAX? is displayed:

a. Enter: The maximum Y value for scaling.

b. Press: (END LINE)

Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 21.

23. When NO. OF Y-AXIS INTERVALS:(<=12)? is displayed:
    a. Enter: The number of Y-axis intervals (<=12).
    b. Press: (END LINE)

    Note: If the number of intervals is not in the range of 1 to 12, the program will beep and go to step 23.

24. When NUMBER OF Y-INT. BETWEEN LABELS? is displayed:
    a. Enter: The number of Y-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.
    b. Press: (END LINE)

    OR:

    a. Enter: 0 if no labels are desired on the Y-axis.
    b. Press: (END LINE)

    Note: If the number of intervals is not in the range of 0 to the entered number of Y-intervals, the program will beep and go to step 24.

25. After DONE is displayed or the plot is finished, any of the options can be selected.
    a. Press: KEY #2 (OUTPUT), to output the data to either the printer or a tape file.
    b. Go to step 26.

    OR:

    a. Press: KEY #6 (EDIT), to edit the data.
    b. Go to step 31.

    OR:

    a. Select the desired regression type by pressing the proper key as shown below:
       KEY #3 (LINEAR)
       KEY #4 (EXP)
       KEY #7 (LOG)
       KEY #8 (POWER)
    b. Go to step 39.

    Note: If CAN'T TAKE LOG is displayed, the data contains values less than or equal to 0 and this regression cannot be done. The program returns to step 25.

26. When PRINT DATA:Y/N? is displayed:
    a. Enter: Y, to print the data.
    b. Press: (END LINE)

    OR:

    a. Enter: N, if a printout of the data is not wanted.
    b. Press: (END LINE)

    Note: You must enter either "Y" or "N" or the program will beep and go to step 26.

27. When STORE DATA:Y/N? is displayed:
    a. Enter: Y, if you want to store the data.
    b. Press: (END LINE)
    c. Go to step 28.

    OR:

    a. Enter: N, if you do not want to store the data.
    b. Press: (END LINE)
    c. Go to step 30.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 27.

28. When ENTER NAME OF FILE? is displayed:
    a. Enter: The file name.
    b. Press: (END LINE)

29. When CREATE FILE:Y/N? is displayed:
    a. Enter: Y, to create the file.
    b. Press: (END LINE)

    OR:

    a. Enter: N, if the file already exists.
    b. Press: (END LINE)

Note: You must enter either "Y" or "N" or the program will beep and go to step 29.

30. When DONE is displayed, go to step 25.
31. When 0=OK, 1=CORRECT, 2=DELETE, 3=INSERT? is displayed:
    a. Enter: 0, if the edit is finished.
    b. Press: END LINE
    c. Go to step 38.

    Note: The program will now re-compute values for the curve fitting and allow you to specify the plotting option.

    OR:

    a. Enter: 1, if you want to correct a data pair.
    b. Press: END LINE
    c. Go to step 32.

    OR:

    a. Enter: 2, if you want to delete a data pair.
    b. Press: END LINE
    c. Go to step 35.

    OR:

    a. Enter: 3, if you want to insert a data pair.
    b. Press: END LINE
    c. Go to step 36.
32. When INDEX OF PAIR TO CORRECT? is displayed:
    a. Enter: The index of the data pair.
    b. Press: END LINE
    c. Go to step 33.

    Note: If the index is greater than the number of data pairs in the data set, go to step 32 and re-enter the index.

    OR:

    a. Enter: A value less than 1 to terminate the correction mode.
    b. Press: END LINE
    c. Go to step 31.
33. When NEW X(_)=? is displayed:
    a. Enter: The correct value.
    b. Press: END LINE
34. When NEW Y(_)=? is displayed:
    a. Enter: The correct value.
    b. Press: END LINE
    c. Go to step 31.
35. When ENTER INDEX OF PAIR TO DELETE? is displayed:
    a. Enter: The index of the pair.
    b. Press: END LINE
    c. Go to step 31.

    Note: If the index is greater than the number of data pairs in the data set, go to step 35 and re-enter the index.

    OR:

    a. Enter: A value less than 1 to terminate the deletion mode.
    b. Press: END LINE
    c. Go to step 31.
36. When ENTER INDEX OF PAIR TO INSERT? is displayed:
    a. Enter: The index of the pair to insert before.
    b. Press: END LINE
    c. Go to step 37.

    Note: If the index is greater than the number of data pairs in the data set plus one, go to step 36 and re-enter the index.

    Note: If MAXIMUM NUMBER OF PAIRS = 200 is displayed, go to step 31 since there is no more room.

    OR:

    a. Enter: A value less than 1 to terminate the insertion mode.
    b. Press: END LINE
    c. Go to step 31.
37. When INSERT X(_),Y(_)? is displayed:
    a. Enter: The X and Y values separated by a comma.
    b. Press: END LINE
    c. Go to step 31.
38. When DONE is displayed, go to step 13.
39. When ESTIMATE Y:Y/N? is displayed:
    a. Enter: Y, if $\hat{y}$ is to be calculated.

b. Press: END LINE
c. Go to step 40.
OR:
a. Enter: N, if no estimates are desired.
b. Press: END LINE
c. Go to step 43.

Note: You must enter either "Y" or "N" or the program will beep and go to step 39.

40. When AT ALL X(I):Y/N? is displayed:
a. Enter: Y, if estimates of Y at all entered X-values are desired.
b. Press: END LINE
c. Go to step 41.
OR:
a. Enter: N, if all are not desired.
b. Press: END LINE
c. Go to step 42.

Note: You must enter either "Y" or "N" or the program will beep and go to step 40.

41. When ESTIMATE Y AT ENTERED X:Y/N? is displayed:
a. Enter: Y, to obtain an estimate of Y.
b. Press: END LINE
c. Go to step 42.
OR:
a. Enter: N, if no more estimates are desired.
b. Press: END LINE
c. Go to step 43.

Note: You must enter either "Y" or "N" or the program will beep and go to step 41.

42. When ESTIMATE Y AT X=? is displayed:
a. Enter: The X-value for computing the Y estimate.
b. Press: END LINE

43. If plotting was selected during entry and PLOT:Y/N? is displayed:
a. Enter: Y, if the regression curve is to be plotted.
b. Press: END LINE
c. Go to step 45.
OR:
a. Enter: N, if the plot is not wanted.
b. Press: END LINE
c. Go to step 25.

Note: You must enter either "Y" or "N" or the program will beep and go to step 43.

44. If plotting was not done during entry, go to step 25.

45. When LABEL PLOT:Y/N? is displayed:
a. Enter: Y, if you want to label the plot.
b. Press: END LINE
c. Go to step 46.
OR:
a. Enter: N, if no label is desired.
b. Press: END LINE
c. Go to step 25.

Note: You must enter either "Y" or "N" or the program will beep and go to step 45.

46. When LABEL ORIGIN:X,Y? is displayed:
a. Enter: The X and Y coordinates where the label is to start.
b. Press: END LINE

Note: If INVALID POSITION is displayed, the entered coordinates are out of the scale limits and the program goes to step 46.

Note: To aid label positioning the following variables may be useful to use.

Variable Name	Description
X0	Minimum X-scaled value
Y0	Minimum Y-scaled value
X1	X-value at axes intercept
Y1	Y-value at axes intercept
X2	X-value at right end of X-axis
Y2	Y-value at top end of Y-axis
Z1	X2—X1
Z2	Y2—Y1
D1	Distance of a dot in X-direction
D2	Distance of a dot in Y-direction

47. When ENTER LABEL? is displayed:

a. Enter: The label.
b. Press: (END LINE)

Note: If LABEL TOO LONG is displayed, the program beeps and goes to step 47.

48. After the label has been drawn, go to step 45.

Example 1:

The following table contains temperature data in degrees Fahrenheit and degrees Celsius. Assume that you do not know the relationship of the two scales and derive the equation using linear regression of the form:

$$F° = a + bC°$$

Temperature Values

Celsius	-130	-40	5	15	25	35
Fahrenheit	-202	-40	41	59	77	95

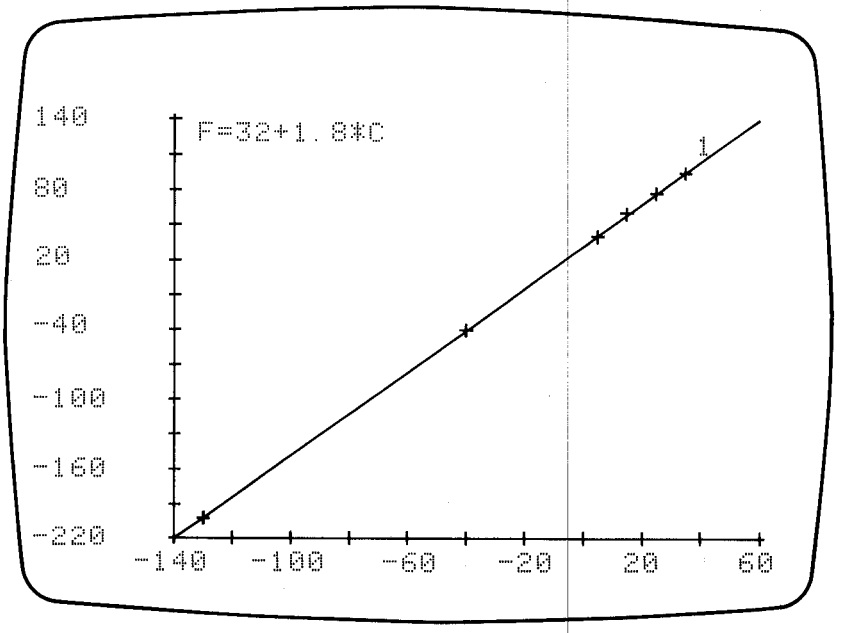
Plot the input and the regression line.

Using the regression curve, what is the temperature in degrees Fahrenheit when C = 22°?

```
   AOV: LINEAR REG:CODE 1
SOURCE/DF       SS        MS        F
TOTAL  5   62370.0
REG    1   62370.0  62370.0  999.9
RESID  4       0.0      0.0
R SQUARE =           1.000

YHAT =     32.000 +        1.800 X

    X(I)        YHAT
    22.00      71.60
```



Example 2:

Many compression processes can be correlated using the power curve

$$p = av^{-b}$$

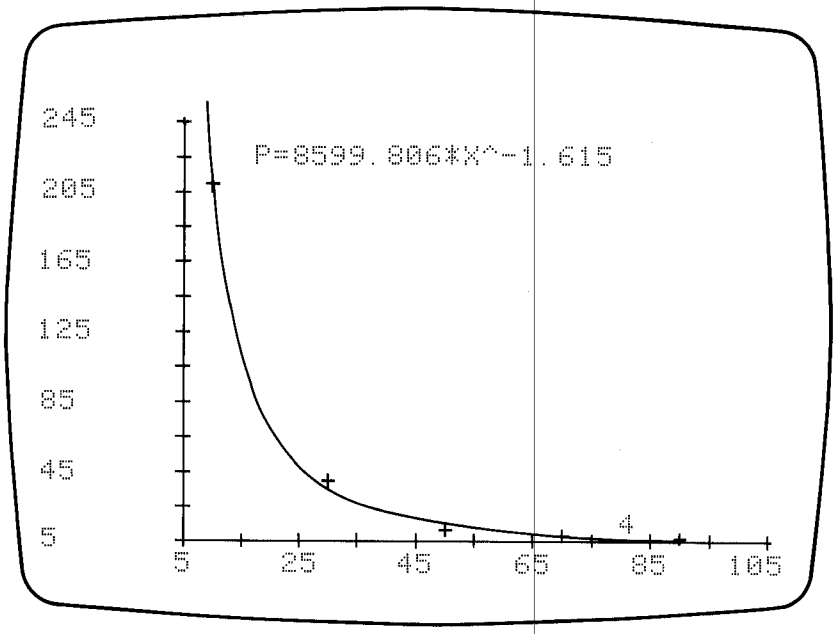
where b is the polytropic constant of the process.

Pressure-volume data for a compression process is shown below. Run a power curve fit to determine the polytropic constant, $-b$. What is the pressure when v is 15?

v	p
10	210
30	40
50	12
70	9
90	6.8

```
    AOV: POWER: CODE 4
SOURCE/DF       SS        MS        F
TOTAL  4        8.0
REG    1        7.9       7.9  245.5
RESID  3        0.1       0.0
R SQUARE =          0.988

YHAT=  8599.806X ^      -1.615
    X(I)        YHAT
   15.00     108.35
```



Auto Function Plot

This program will automatically set up the scaling factors and plot a user defined function. You must store the function as a single or multi-line function starting at line 5000 before running this program. Up to 25 points of singularity can be entered which will be checked and skipped before calling the function. A table of values can also be printed at your request.

Most of the work involved with plotting is taken care of by this program, but since this program is designed to plot a general function, it has some generalities built into it. The formatting of the labels and the positioning of the axes are areas which may need customization if your plots do not lend themselves to the spacing provided.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "FPLOT"
   b. Press: (END LINE)
3. Type the function, FNF, to be plotted starting at line 5000.
   Note: Make sure that any lines after line 5000 which are not in your function are deleted before running the program.
4. To start the program:
   a. Press: (RUN)
5. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP) if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 5.
   OR:
   a. Press: KEY #1 (DEFINE) to enter the scale parameters.
   b. Go to step 6.
6. When ENTER SCALE XMIN? is displayed:
   a. Enter: The minimum X-value.
   b. Press: (END LINE)
7. When ENTER SCALE XMAX? is displayed:
   a. Enter: The maximum X-value.
   b. Press: (END LINE)

   Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 6.
8. When VERTICAL/HORIZONTAL LABELS: V/H? is displayed:
   a. Enter: V, if the X-axis labels are to be written vertically.
   b. Press: (END LINE)
   OR:
   a. Enter: H, if the X-axis labels are to be written horizontally.
   b. Press: (END LINE)

   Note: You must enter either "V" or "H" or the program will beep and go to step 8.
9. When NO. OF X-AXIS INTERVALS: (<=16)? is displayed:
   a. Enter: The number of X-axis intervals (<=16).
   b. Press: (END LINE)

   Note: If the number of intervals is not in the range of 1 to 16, the program will beep and go to step 9.

10. When NUMBER OF X-INT. BETWEEN LABELS? is displayed:
    a. Enter: The number of X-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.
    b. Press: (END LINE)

    OR:

    a. Enter: 0, if no labels are desired on the X-axis.
    b. Press: (END LINE)

    Note: If the number of intervals is not in the range of 0 to the entered number of X-intervals, the program will beep and go to step 10.

11. When AUTO SCALING: Y/N? is displayed:
    a. Enter: Y, if the plotting area is to be scaled using the Y-values generated over the range of XMIN to XMAX.
    b. Press: (END LINE)
    c. Go to step 14.

    OR:

    a. Enter: N, if you want to enter the Y-scaling information.
    b. Press: (END LINE)

    Note: By specifying the end points, you can have better control of the axis labels.

    Note: You must enter "Y" or "N" or the program will beep and go to step 11.

12. When ENTER SCALE YMIN? is displayed:
    a. Enter: The minimum Y-value.
    b. Press: (END LINE)

13. When ENTER SCALE YMAX? is displayed:
    a. Enter: The maximum Y-value.
    b. Press: (END LINE)

    Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 12.

14. When NUMBER OF Y-AXIS INTERVALS: (<=12)? is displayed:
    a. Enter: The number of Y-axis intervals (<=12).
    b. Press: (END LINE)

    Note: If the number of intervals is not in the range of 1 to 12, the program will beep and go to step 14.

15. When NUMBER OF Y-INT. BETWEEN LABELS? is displayed:
    a. Enter: The number of Y-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.
    b. Press: (END LINE)

    OR:

    a. Enter: 0, if no labels are desired on the Y-axis.
    b. Press: (END LINE)

    Note: If the number of intervals is not in the range of 0 to the entered number of Y-intervals, the program will beep and go to step 15.

16. After scaling the plotting area and entering the function at line 5000, select the options using the specified function keys:
    a. Press: KEY #2 (SINGUL) to enter points of singularity.
    b. Go to step 17.

    OR:

    a. Press: KEY #3 (FUL PLT) to generate a full plot.
    b. Go to step 19.

    Note: This operation will clear the graphics screen and redraw the axes with labels.

    OR:

    a. Press: KEY #4 (TABLE) to generate a table of function values on the printer.
    b. Go to step 26.

OR:

a. Press: KEY #7 (PLOT) to plot the function only over a specified range.
b. Go to step 19.
OR:
a. Press: KEY #8 (LABEL) to label the plot at an entered position.
b. Go to step 31.

17. When ENTER POINT OF SINGULARITY_? is displayed:
a. Enter: The point of singularity.
b. Press: (END LINE)

18. When MORE POINTS:Y/N?" is displayed:
a. Enter: Y, to enter more points.
b. Press: (END LINE)
c. Go to step 17.
Note: If NO MORE CAN BE ENTERED, SINCE 25 POINTS HAVE BEEN ENTERED is displayed, go to step 16.
OR:
a. Enter: N, if there are no more points.
b. Press: (END LINE)
c. Go to step 16.
Note: You must enter "Y" or "N" or the program will beep and go to step 18.

19. When ENTER XMIN? is displayed:
a. Enter: The minimum X-value to be plotted.
b. Press: (END LINE)

20. When ENTER XMAX? is displayed:
a. Enter: The maximum X-value to be plotted.
b. Press: (END LINE)

21. When ENTER INCREMENT? is displayed:
a. Enter: The increment for plotting.
b. Press: (END LINE)
c. Go to step 23.
OR:
a. Enter: 0 if the number of intervals is to be entered rather than the increment size.
b. Press: (END LINE)

22. When ENTER # PLOT INCREMENTS? is displayed:
a. Enter: The number of plot increments.
b. Press: (END LINE)

23. After the plot is finished, the program will beep.

24. If another option is desired using the same function, go to step 16.

25. If a new function is desired:
a. Press: (STEP PAUSE)
b. Go to step 3.

26. When ENTER XMIN? is displayed:
a. Enter: The minimum X-value to be printed.
b. Press: (END LINE)

27. When ENTER XMAX? is displayed:
a. Enter: The maximum X-value to be printed.
b. Press: (END LINE)

28. When ENTER INCREMENT? is displayed:
a. Enter: The increment for printing.
b. Press: (END LINE)
c. Go to step 30.
OR:
a. Enter: 0 if the number of intervals is to be entered rather than the increment size.
b. Press: (END LINE)

29. When ENTER # PLOT INCREMENTS? is displayed:
a. Enter: The number of increments for printing the table.
b. Press: (END LINE)

30. After the table is printed, go to step 24.

31. When LABEL ORIGIN:X,Y ? is displayed:
a. Enter: The X and Y coordinates where the label is to start.
b. Press: (END LINE)

Note: If INVALID POSITION is displayed, the entered coordinates are out of the scale limits and the program goes to step 31.

Note: To aid label positioning the following variables may be useful.

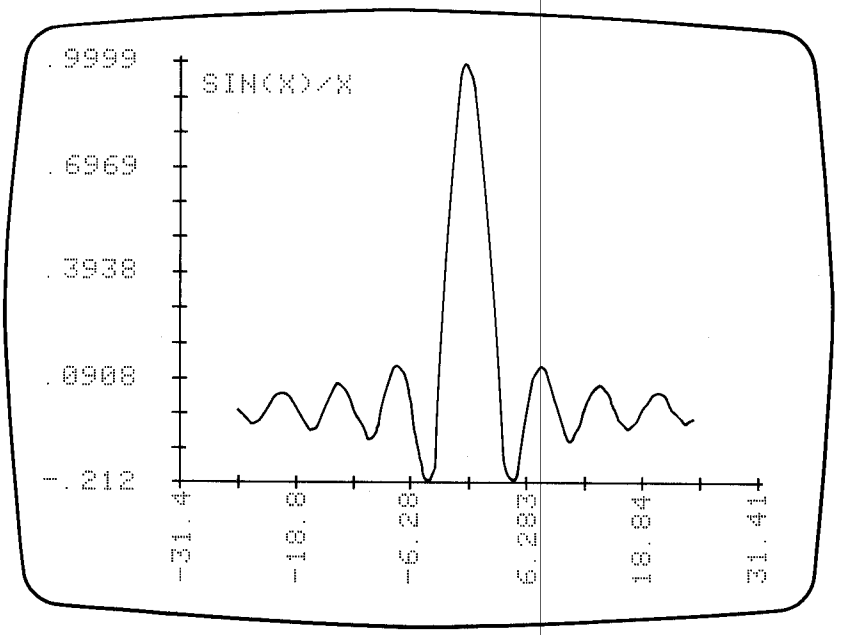
Variable Name	Description
X0	Minimum X-scaled value
Y0	Minimum Y-scaled value
X1	X-value at axes intercept
Y1	Y-value at axes intercept
X2	X-value at right end of X-axis
Y2	Y-value at top end of Y-axis
Z1	X2—X1
Z2	Y2—Y1
D1	Distance of a dot in X-direction
D2	Distance of a dot in Y-direction

32. When ENTER LABEL? is displayed:
    a. Enter: The label.
    b. Press: END LINE

    Note: If LABEL TOO LONG is displayed, the program beeps and goes to step 32.
33. After the label has been drawn, go to step 24.

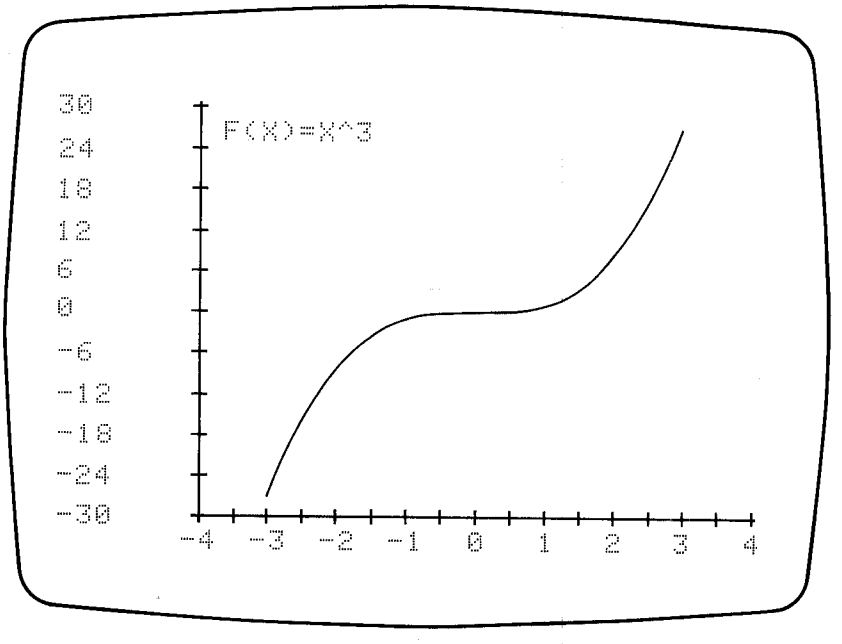
Example 1:

Using the default function, $f(x) = \text{SIN}(x)/x$, which is stored as DEF FNF(X) at line 5000, plot the function over the range of −8*PI to 8*PI using an increment of PI/4. The scaled range should be −10*PI to 10*PI. For the X-axis, specify vertical labels with 10 intervals and labels at every other tic. For the Y-axis, specify auto scaling with 12 intervals and labels at every 3 tics. Remember to enter 0 as a point of singularity.



Example 2:

Replace the default function with X^3 and generate a plot from −3 to 3 using an increment of .05 on a scaled range of −4 to 4. For the X-axis, specify horizontal labels with 16 intervals and labels at every other tic. For the vertical scale, enter a scale maximum of 30 and a minimum of −30. The Y-axis should have 10 intervals with labels at every tic.



Notes

Auto Data Plot

This program will automatically set up the scaling factors and plot a user entered set of paired data. You can either enter the data from the keyboard or from a data file. The data set can contain up to 200 data points.

After the data has been entered, you can print it, edit it, and plot it. In the plot specification, you can specify the scale factors or let the program automatically set up the scale factors. You are able to select tic spacing and label spacing on each axis. The X-axis labels can either be vertical or horizontal. You can also specify no labels on an axis if you wish. After the plot is completed, you can draw a grid or label the plot.

As with other generalized plotting programs, the program may not suit your needs. The formatting of the labels and the position of the axes are areas which may need customization if your plots do not lend themselves to the spacing provided.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "DPLOT"
   b. Press: (END LINE)
3. To run the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP) if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 4.

   OR:

   a. Press: KEY #1 (ENTER) to enter the data.
   b. Go to step 5.
5. When PRINT DATA ON INPUT: Y/N? is displayed:
   a. Enter: Y, if the data is to be printed on entry.
   b. Press: (END LINE)

   OR:

   a. Enter: N, if the data is not to be printed on entry.
   b. Press: (END LINE)

   Note: You must enter either "Y" or "N" or the program will beep and go to step 5.
6. When ENTER FROM KEYBOARD/TAPE: K/T? is displayed:
   a. Enter: K, if the data is to be entered one pair at a time from the keyboard.
   b. Press: (END LINE)
   c. Go to step 7.

   OR:

   a. Enter: T, if the data in a data file is to be entered.
   b. Press: (END LINE)
   c. Go to step 11.

   Note: You must enter either "K" or "T" or the program will beep and go to step 6.
7. When ENTER NUMBER OF POINTS: 200 MAX. ? is displayed:
   a. Enter: The number of data points.
   b. Press: (END LINE)

   Note: If the number of points is not valid,

INVALID NUMBER OF POINTS will be displayed and the program will go to step 7.

8. When X(_),Y(_)? is displayed:
   a. Enter: The specified point values.
   b. Press: END LINE
9. Repeat step 8 for each point.
10. Go to step 12.
11. When ENTER FILE NAME? is displayed:
    a. Enter: The file name.
    b. Press: END LINE
    c. After the data has been loaded go to step 12.

    Note: If the file does not exist, go to step 11.
12. When the data has been entered, select the desired option using the specified function keys:
    a. Press: KEY #2 (OUTPUT) to output the array values to the printer or to the tape.
    b. Go to step 13.

    OR:

    a. Press: KEY #3 (SETUP) to set up the scale and axes.
    b. Go to step 18.

    OR:

    a. Press: KEY #4 (PLOT) to plot the data on the currently defined axes. Set up first.
    b. Go to step 30.

    OR:

    a. Press: KEY #6 (EDIT) to edit the data in memory.
    b. Go to step 34.

    OR:

    a. Press: KEY #7 (GRID) to draw a grid at the label positions. Set up first.
    b. Go to step 12 after the grid has been drawn.

    OR:

    a. Press: KEY #8 (LABEL) to label the plot at an entered position. Set up first.
    b. Go to step 42.

    OR:

    a. Go to step 4 for a new data set.
13. When PRINT DATA:Y/N? is displayed:
    a. Enter: Y, if the data is to be printed.
    b. Press: END LINE

    OR:

    a. Enter: N, if the data is not to be printed.
    b. Press: END LINE

    Note: You must enter either "Y" or "N" or the program will beep and go to step 13.
14. When STORE DATA:Y/N? is displayed:
    a. Enter: Y, to store the data.
    b. Press: END LINE
    c. Go to step 15.

    OR:

    a. Enter: N, to not store the data.
    b. Press: END LINE
    c. Go to step 12.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 14.
15. When ENTER FILE NAME? is displayed:
    a. Enter: The file name.
    b. Press: END LINE
16. When CREATE FILE:Y/N? is displayed:
    a. Enter: Y, if the file must be created.
    b. Press: END LINE

    OR:

    a. Enter: N, if the file already exists.
    b. Press: END LINE

    Note: You must enter either "Y" or "N" or the program will beep and go to step 16.

    Note: If any errors occur when storing the data, the program will go to step 15.
17. After the data has been stored, go to step 12.
18. When AUTO X-SCALING:Y/N? is displayed:
    a. Enter: Y, if the X-minimum and X-maximum values are to be used by the program.
    b. Press: END LINE
    c. Go to step 21.

OR:

a. Enter: N, if you want to enter the X-minimum and X-maximum values.

b. Press: (END LINE)

Note: By specifying the end points you can have better control of the axis labels.

Note: You must enter either "Y" or "N" or the program will beep and go to step 18.

19. When ENTER SCALE XMIN? is displayed:

a. Enter: The minimum X-value for scaling.

b. Press: (END LINE)

20. When ENTER SCALE XMAX? is displayed:

a. Enter: The maximum X-value for scaling.

b. Press: (END LINE)

Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 19.

21. When VERTICAL/HORIZONTAL LABELS: V/H? is displayed:

a. Enter: V, if the X-axis labels are to be written vertically.

b. Press: (END LINE)

OR:

a. Enter: H, if the X-axis labels are to be written horizontally.

b. Press: (END LINE)

Note: You must enter either "V" or "H" or the program will beep and go to step 21.

22. When NO. OF X-AXIS INTERVALS: (<=16)? is displayed:

a. Enter: The number of X-axis intervals (≤16).

b. Press: (END LINE)

Note: If the number of intervals is not in the range of 1 to 16, the program will beep and go to step 22.

23. When NUMBER X-INT. BETWEEN LABELS? is displayed:

a. Enter: The number of X-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.

b. Press: (END LINE)

OR:

a. Enter: 0 if no labels are desired on the X-axis.

b. Press: (END LINE)

Note: If the number of intervals is not in the range of 0 to the entered number of X-intervals, the program will beep and go to step 23.

24. When AUTO Y-SCALING: Y/N? is displayed:

a. Enter: Y, if the Y-minimum and Y-maximum values are to be used by the program.

b. Press: (END LINE)

c. Go to step 27.

OR:

a. Enter: N, if you want to enter the Y-minimum and Y-maximum values.

b. Press: (END LINE)

Note: By specifying the end points you can have better control of the axis labels.

Note: You must enter either "Y" or "N" or the program will beep and go to step 24.

25. When ENTER SCALE YMIN? is displayed:

a. Enter: The minimum Y value for scaling.

b. Press: (END LINE)

26. When ENTER SCALE YMAX? is displayed:

a. Enter: The maximum Y value for scaling.

b. Press: (END LINE)

Note: If the maximum value is less than or equal to the minimum value, the program will beep and go to step 25.

27. When NO. OF Y-AXIS INTERVALS: (<=12)? is displayed:

a. Enter: The number of Y-axis intervals (<=12).
b. Press: END LINE

Note: If the number of intervals is not in the range of 1 to 12, the program will beep and go to step 27.

28. When NUMBER Y-INT. BETWEEN LABELS? is displayed:
    a. Enter: The number of Y-intervals between labels, e.g., if labels are desired at every other tic, the number of intervals between labels is 2.
    b. Press: END LINE

    OR:

    a. Enter: 0 if no labels are desired on the Y-axis.
    b. Press: END LINE

    Note: If the number of intervals is not in the range of 0 to the entered number of Y-intervals, the program will beep and go to step 28.
29. When PLOT DEFINED is displayed, go to step 12.
30. When INDEX OF FIRST POINT? is displayed:
    a. Enter: The array index of the first point to be plotted.
    b. Press: END LINE

    Note: If the value is less than one, the program assumes that the value is one.

    Note: If MAXIMUM NUMBER OF POINTS IS__ is displayed, the program goes to step 30.
31. When INDEX OF LAST POINT? is displayed:
    a. Enter: The index of the last point to be plotted.
    b. Press: END LINE

    Note: If MAXIMUM NUMBER OF POINTS IS__ is displayed, the program goes to step 31.

    Note: If LAST POINT IS < FIRST is displayed, the program goes to step 30.
32. When LINE TYPE: LINE/DOT/+/o(1,2,3,4)? is displayed:
    a. Enter: The code for the desired line type (1, 2, 3, or 4).
    b. Press: END LINE

    Note: If INVALID LINE TYPE is displayed, the program beeps and goes to step 32.
33. After the plot is finished, go to step 12.
34. When 0=OK,1=CORRECT,2=DELETE,3=INSERT? is displayed:
    a. Enter: 0 if the edit is finished.
    b. Press: END LINE
    c. Go to step 12.

    OR:

    a. Enter: 1 if you want to correct a data pair.
    b. Press: END LINE
    c. Go to step 35.

    OR:

    a. Enter: 2, if you want to delete a data pair.
    b. Press: END LINE
    c. Go to step 38.

    OR:

    a. Enter: 3, if you want to insert a data pair.
    b. Press: END LINE
    c. Go to step 39.
35. When ENTER INDEX OF PAIR TO CORRECT? is displayed:
    a. Enter: The index of the data pair.
    b. Press: END LINE
    c. Go to step 36.

    Note: If the index is greater than the number of data pairs in the data set, go to step 35 and re-enter the index.

    OR:

a. Enter: A value less than 1 to terminate the correction mode.
b. Press: END LINE
c. Go to step 34.

36. When NEW X(_)=? is displayed:
a. Enter: The correct value.
b. Press: END LINE

37. When NEW Y(_)=? is displayed:
a. Enter: The correct value.
b. Press: END LINE
c. Go to step 34.

38. When ENTER INDEX OF PAIR TO DELETE? is displayed:
a. Enter: The index of the pair.
b. Press: END LINE
c. Go to step 34.

Note: If the index is greater than the number of data pairs in the data set, go to step 38 and re-enter the index.

OR:

a. Enter: A value less than 1 to terminate the deletion mode.
b. Press: END LINE
c. Go to step 34.

39. When ENTER INDEX OF PAIR TO INSERT? is displayed:
a. Enter: The index of the pair.
b. Press: END LINE
c. Go to step 40.

Note: If the index is greater than the number of data pairs in the data set plus one, go to step 39 and re-enter the index.

Note: If MAXIMUM NUMBER OF PAIRS = 200 is displayed, go to step 34 since there is no more room.

OR:

a. Enter: A value less than 1 to terminate the insertion mode.
b. Press: END LINE
c. Go to step 34.

40. When INSERT X(_)=? is displayed:
a. Enter: The X value.
b. Press: END LINE

41. When INSERT Y(_)=? is displayed:
a. Enter: The Y value.
b. Press: END LINE
c. Go to step 34.

42. When LABEL ORIGIN:X,Y? is displayed:
a. Enter: The X and Y coordinates where the label is to start.
b. Press: END LINE

Note: If INVALID POSITION is displayed, the entered coordinates are out of the scale limits and the program will beep and go to step 42.

Note: To aid label positioning the following variables may be useful to use.

Variable Name	Description
X0	Minimum X-scaled value
Y0	Minimum Y-scaled value
X1	X-value at axes intercept
Y1	Y-value at axes intercept
X2	X-value at right end of X-axis
Y2	Y-value at top end of Y-axis
Z1	X2—X1
Z2	Y2—Y1
D1	Distance of a dot in X-direction
D2	Distance of a dot in Y-direction

43. When ENTER LABEL? is displayed:
a. Enter: The label.
b. Press: END LINE

Note: If LABEL TOO LONG is displayed, the program beeps and goes to step 43.

44. After the label has been drawn, go to step 12.

1. The following data was obtained using the BEEP conversion functions in the owner's manual and is to be plotted.

Frequency Parameter	Duration Parameter
114	883
107	935
101	985
94	1050
88	1113
83	1171
77	1250
72	1324
68	1390
63	1483
59	1566
55	1659

The example plot was done using the responses shown in the table below:

Question	Response

Notes

Histogram Generator

This program will draw a histogram based on user entered data. The data can be entered either from the keyboard or from a tape file. Once the data has been entered, it can be edited, printed, plotted, stored and output with cell statistics. The program will automatically sort up to 200 values into from 1 to 50 intervals or bins of equal width specified by you. The histogram which is generated will be scaled automatically and labelled. The cell limit labels are limited to 5 spaces. If the labels take more space than this, they will be defaulted to a general message stating the cell size and the starting value.

Since this program has been designed to draw histograms for a generalized data base, there are aspects which could be changed to fit a particular data base. The major limitation in designing a program for a generalized data base, is in the formatting of the output. The spacing for the labelling of the histogram may be insufficient for some applications, but also be too large for others. The size of the data base was arbitrarily set at 200 and the maximum number of cells was set at 50. Both of these limits were selected to fit the anticipated needs of the average user, but can be changed if the data base is larger or the desired number of cells is larger. To make any changes to the program, you should refer to the documentation of this program for further assistance.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "HISTO"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 4.
   OR:
   a. Press: KEY #1 (ENTER) to enter the data.
5. When PRINT DATA ON INPUT : Y/N? is displayed:
   a. Enter: Y, if the data is to be printed on entry.
   b. Press: (END LINE)
   OR:
   a. Enter: N, if the data is not to be printed.
   b. Press: (END LINE)

   Note: You must enter either "Y" or "N" or the program will beep and go to step 5.
6. When ENTER FROM KEYBOARD OR TAPE : K/T? is displayed:
   a. Enter: K, if the data is to be entered from the keyboard.
   b. Press: (END LINE)
   OR:
   a. Enter: T, if the data is on a tape file.
   b. Press: (END LINE)
   c. Go to step 11.

   Note: You must enter either "K" or "T" or the program will beep and go to step 6.
7. When ENTER NUMBER OF POINTS? is displayed:

a. Enter: The number of points.
b. Press: (END LINE)

Note: If the number of points is not in the range of 2 to 200, go to step 7 and enter a number in the acceptable range.

8. When X(__)? is displayed:
   a. Enter: The value specified.
   b. Press: (END LINE)
9. Repeat step 8 for each value.
10. Go to step 12.
11. When ENTER FILE NAME? is displayed:
    a. Enter: The file name.
    b. Press: (END LINE)
    c. After the data has been loaded go to step 12.

    Note: If the file does not exist, go to step 11.
12. When the data has been entered and DONE is displayed, select the desired option using the specified function keys:
    a. Press: KEY #2 (OUTPUT) to output the array values to the printer or to the tape.
    b. Go to step 13.

    OR:

    a. Press: KEY #3 (PLOT) to plot the histogram.
    b. Go to step 19.

    OR:

    a. Press: KEY #4 (NORMAL) to have a normal curve overlaid over the plot.
    b. Go to step 12.

    OR:

    a. Press: KEY #6 (EDIT) to edit the data in memory.
    b. Go to step 24.

    OR:

    a. Press: KEY #7 (LABEL) to label the plot at an entered position.
    b. Go to step 30.

    OR:

    a. Press: KEY #8 (COPY) to print the cell statistics and copy the histogram to the printer.
    b. Go to step 12.
13. When PRINT DATA:Y/N? is displayed:
    a. Enter: Y, if the data is to be printed.
    b. Press: (END LINE)
    c. Go to step 14.

    OR:

    a. Enter: N, if the data is not to be printed.
    b. Press: (END LINE)
    c. Go to step 15.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 13.
14. When PRINT DATA ON PRINTER/DISP:P/D? is displayed:
    a. Enter: P, if the data is to be printed on the printer.
    b. Press: (END LINE)

    OR:

    a. Enter: D, if the data is to be printed on the display.
    b. Press: (END LINE)

    Note: You must enter either "P" or "D" or the program will beep and go to step 14.
15. When STORE DATA:Y/N? is displayed:
    a. Enter: Y, to store the data.
    b. Press: (END LINE)
    c. Go to step 16.

    OR:

    a. Enter: N, to not store the data.
    b. Press: (END LINE)
    c. Go to step 12.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 15.
16. When ENTER NAME OF FILE? is displayed:
    a. Enter: The file name.
    b. Press: (END LINE)
17. When CREATE FILE:Y/N? is displayed:

a. Enter: Y, if the file must be created.
b. Press: END LINE

OR:

a. Enter: N, if the file already exists.
b. Press: END LINE

Note: You must enter either "Y" or "N" or the program will beep and go to step 17.

Note: If any errors occur when storing the data, the program will go to step 16.

18. After the data has been stored, go to step 12.
19. When OFFSET=? is displayed:
    a. Enter: The desired offset.
    b. Press: END LINE

    Note: If OFFSET TOO BIG: MAX VALUE=_ is displayed, go to step 19 and enter a smaller offset.
20. When # OF CELLS? is displayed:
    a. Enter: The number of cells.
    b. Press: END LINE

    Note: If # OF CELLS OUT OF BOUNDS: (1,50) is displayed, go to step 20 and enter a valid number of cells.
21. When OPTIMUM CELL WIDTH=_ CELL WIDTH? is displayed:
    a. Enter: The desired cell width.
    b. Press: END LINE

    Note: The optimum cell width is given by:

$$\frac{X_{max} - \text{offset}}{\#\text{ of cells}}$$

22. If _ OBS. TOO SMALL FOR OFFSET or _ OBS. TOO LARGE FOR OFFSET is displayed and then OFFSET & CELL WIDTH OK:Y/N? displayed:
    a. Enter: Y, if the specified information is acceptable.
    b. Press: END LINE

    OR:

    a. Enter: N, if you want to change the offset or cell width.
    b. Press: END LINE
    c. Go to step 19.

    Note: This case results when there are observations, i.e., data values, which fall outside of the specified range. (Offset, Offset + # Cells * Cell Width). The histogram will still be drawn if you want it.
23. After the histogram is generated, go to step 12.
24. When 0=OK,1=CORRECT,2= DELETE,3=INSERT? is displayed:
    a. Enter: 0 if the edit is finished.
    b. Press: END LINE
    c. Go to step 12.

    OR:

    a. Enter: 1 if you want to correct a data item.
    b. Press: END LINE
    c. Go to step 25.

    OR:

    a. Enter: 2 if you want to delete a data item.
    b. Press: END LINE
    c. Go to step 27.

    OR:

    a. Enter: 3 if you want to insert a data item.
    b. Press: END LINE
    c. Go to step 28.
25. When ENTER INDEX OF ITEM TO CORRECT? is displayed:
    a. Enter: The index of the item.
    b. Press: END LINE
    c. Go to step 26.

    Note: If the index is greater than the number in the data set, go to step 25 and re-enter the index.

    OR:

    a. Enter: A value less than 1 to terminate the correction mode.
    b. Press: END LINE
    c. Go to step 24.

26. When NEW X(_)=? is displayed:
    a. Enter: The correct value.
    b. Press: END LINE
    c. Go to step 24.
27. When ENTER INDEX OF ITEM TO DELETE? is displayed:
    a. Enter: The index of the item.
    b. Press: END LINE
    c. Go to step 24.

    Note: If the index is greater than the number of items in the data set, go to step 27 and re-enter the index.

    OR:

    a. Enter: A value less than 1 to terminate the deletion mode.
    b. Press: END LINE
    c. Go to step 24.
28. When ENTER INDEX OF ITEM TO INSERT? is displayed:
    a. Enter: The index of the item.
    b. Press: END LINE
    c. Go to step 29.

    Note: If the index is greater than the number of items in the data set plus one, go to step 28 and re-enter the index.

    Note: If MAXIMUM NUMBER OF ITEMS = 200 is displayed, go to step 24 since there is no more room.

    OR:

    a. Enter: A value less than 1 to terminate the insertion mode.
    b. Press: END LINE
    c. Go to step 24.
29. When INSERT X(_)=? is displayed:
    a. Enter: The X value.
    b. Press: END LINE
    c. Go to step 24.
30. When LABEL ORIGIN:X,Y? is displayed:
    a. Enter: The X and Y coordinates where the label is to start.
    b. Press: END LINE

    Note: If INVALID POSITION is displayed, the entered coordinates are out of the scale limits and the program goes to step 30.

    Note: To aid label positioning the following variables may be useful to use.

Variable Name	Description
X0	Minimum X-scaled value
Y0	Minimum Y-scaled value
O	Offset
N9	Maximum number of points in a cell
C	Cell width
D1	Distance of a dot in X-direction
D2	Distance of a dot in Y-direction

31. When ENTER LABEL? is displayed:
    a. Enter: The label.
    b. Press: END LINE

    Note: If LABEL TOO LONG is displayed, the program beeps and goes to step 31.
32. After the label has been drawn, go to step 12.

Example:

A teacher gave a test to 25 students and wishes to see a histogram of the results to determine whether the grades were skewed high or low. The test grades are shown below:

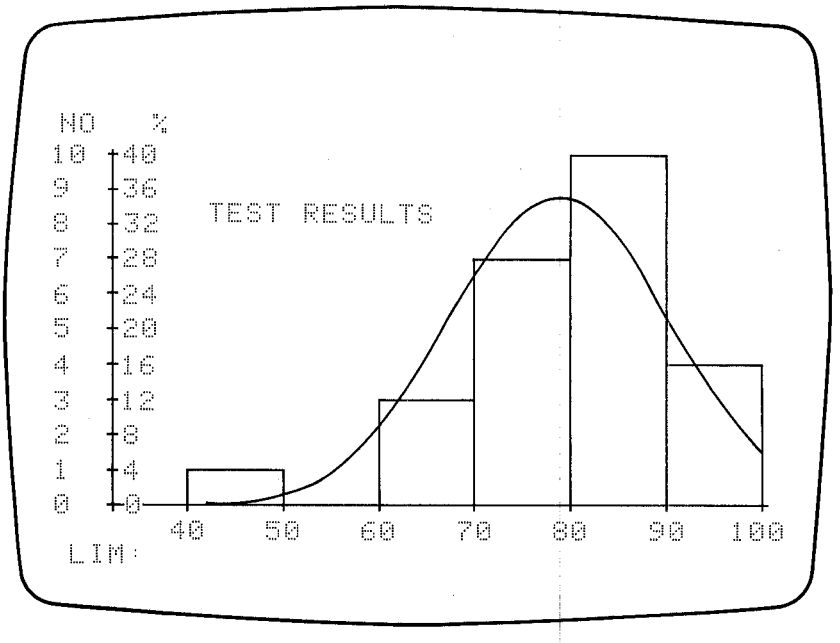
Student #	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25
Grade	77	65	82	91	74	83	96	61	48	72	81	88	89	73	83	84	90	71	66	88	83	77	94	85	72

After entering the test scores, use the responses shown below to duplicate the example plot.

Question	Response
OFFSET=?	40
# OF CELLS	6
OPTIMUM CELL WIDTH = 9.33342666666	
CELL WIDTH?	10

```
   I          X(I)          X(I+1)
   1          77.0000       65.0000
   3          82.0000       91.0000
   5          74.0000       83.0000
   7          96.0000       61.0000
   9          48.0000       72.0000
  11          81.0000       88.0000
  13          89.0000       73.0000
  15          83.0000       84.0000
  17          90.0000       71.0000
  19          66.0000       88.0000
  21          83.0000       77.0000
  23          94.0000       85.0000
  25          72.0000

 OFFSET=                    40
 CELL WIDTH= 10
```



CELL STATISTICS

CELL#	LOWER LIMIT	NUMBER OF OBS.	%RELATIVE FREQUENCY
1	40.00	1	4.00
3	60.00	3	12.00
4	70.00	7	28.00
5	80.00	10	40.00
6	90.00	4	16.00

Arithmetic Teacher

Preschool and elementary school students may use this program to help them learn addition, subtraction, multiplication, and division. Secondary school students can test algebra skills using the algebra section of this program. The program randomly generates problems within a specified range which is defaulted to 9. A lesson consists of 10 correctly answered problems. After problem 10, the number correct on first and second tries and the total number of problems tried will be printed. The child can select any type of problem or a mixed set of arithmetic problems. The problem type will be printed after pressing the selection key.

The algebra section provides a basic drill in 4 types of algebra problems as shown:

$$ax = b$$
$$ax + b = c$$
$$a(x + b) = c$$
$$a(x - b) + c(x - d) = e$$

A student can select any type of algebra problem.

All problems require mental computation of the answer and check for usage of the computer to solve the problem. The random numbers are generated using the built-in generator. The seed used by the random number generator can be entered in the "START" section. When the lesson is finished, a report will be printed showing the student's success during the lesson.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "TEACH"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When WHAT IS YOUR NAME? is displayed:
   a. Enter: Your name. (<=32 characters)
   b. Press: (END LINE)
5. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 5.

   OR:
   a. Press: KEY #6 (START), if you want to specify either the maximum number size or the seed for generating the problems which are not as defaulted.
   b. Go to step 6.

   OR:
   a. Go to step 8 to select the problem type.
6. When ENTER MAXIMUM NUMBER? is displayed:
   a. Enter: The maximum value for factors.

b. Press: END LINE

Note: If MAXIMUM MUST BE POSITIVE is displayed, go to step 6 and enter a value greater than 1.

7. When ENTER OPTIONAL SEED:0=NONE? is displayed:
   a. Enter: A value for seeding the random number generator.
   b. Press: END LINE

   OR:

   a. Enter: 0, if no seed is to be used.
   b. Press: END LINE
8. To select problem type:
   a. Press: KEY #1 (+) for addition problems.
   b. Go to step 9.

   OR:

   a. Press: KEY #2 (−) for subtraction problems.
   b. Go to step 9.

   OR:

   a. Press: KEY #3 (*) for multiplication problems.
   b. Go to step 9.

   OR:

   a. Press: KEY #4 (/) for division problems.
   b. Go to step 9.

   OR:

   a. Press: KEY #7 (MIXED) for mixed addition, subtraction, multiplication, and division problems.
   b. Go to step 9.

   OR:

   a. Press: KEY #8 (ALGEBRA) for algebra problems.
   b. Go to step 14.

   OR:

   a. Go to step 5 to specify new problem conditions or obtain an explanation.
9. When ANSWER? is displayed:
   a. Enter: The answer to the displayed problem.
   b. Press: END LINE
10. If YOUR ANSWER IS WRONG. TRY AGAIN is displayed, go to step 9 and try again.
11. If YOUR ANSWER IS STILL WRONG RIGHT ANSWER IS__ is displayed, you entered the wrong answer twice.
12. Repeat steps 9-11 until you have answered 10 problems correctly on either the first or second try.
13. When your lesson is finished, the number of problems answered correctly on the first try, number of problems answered correctly on the second try, and the total number of problems tried will be printed.
    a. Go to step 5 to specify new problem conditions.

    OR:

    a. Go to step 8 to start a new problem set.
14. When the problem types and WHICH DO YOU WANT? are displayed:
    a. Enter: The type code (1-4) to specify the desired problem type.
    b. Press: END LINE

    Note: You must enter a number in the range of 1 to 4 or the program will go to step 14.
15. When the problem is displayed:
    a. Enter: The answer to the displayed problem:
    b. Press: END LINE
16. If YOUR ANSWER IS WRONG: TRY AGAIN is displayed, go to step 15 and try again.
17. If YOUR ANSWER IS STILL WRONG
    RIGHT ANSWER IS__ is displayed, you entered the wrong answer twice.
18. Repeat steps 15-17 until you have answered 10 problems correctly on either the first or second try.
19. Go to step 13.

Example 1:

Using PI as the seed for the random number generator and twelve as the maximum number, do a set of 10 multiplication problems.

```
MULTIPLICATION PROBLEMS
MAXIMUM FACTOR =  12

HI I. QUEUE
YOU GOT ALL YOUR PROBLEMS RIGHT
ON THE 1ST TRY. CONGRATULATIONS!
```

Example 2:

Using .61422533 as the seed for the random number generator and ten as the maximum number, do a set of 10 type 2 algebra problems.

```
ALGEBRA PROBLEMS:TYPE  2
MAXIMUM FACTOR =  10

HI I. QUEUE
YOU TRIED  10  PROBLEMS.
 9  WERE RIGHT ON THE 1ST TRY.
 1  WAS CORRECT ON THE 2ND TRY.
```

Notes

Calendar Functions

For the period October 15, 1582 through November 25, 4046, this program interchangeably solves for dates and days. Given two dates, the number of days between them or the number of week days between them can be calculated. Given one date and a specified number of days, a second date can be found. Given a date, the day-of-week and day-of-year can be calculated. Given a month and year, a calendar can be plotted and printed.

A date must be input in mm.ddyyyy format. For instance, April 6, 1978 is keyed in as 4.061978. It is important that the zero between the decimal point and the day of the month be included when the day of the month is less than 10. The number of weekdays between two dates is based on a noon-to-noon time length, so the difference between a weekday and a non-weekday will have the half-day in it, e.g., the number of week days between a Friday and Saturday in the same week is .5.

Equations:

To compute the day number from the date:

$$\begin{aligned} \textit{Julian Day number} &= \text{INT}(365.25y') - \text{INT}(y'/100) \\ &\quad + \text{INT}(y'/400) + \text{INT}(30.6001m') \\ &\quad + D - 478164 \end{aligned}$$

The range of calculations allows for this value to be in the range

$$100000 < JD_{\text{ADJ}} < 999999.$$

where

$$y' = \begin{cases} Y - 1 & \text{if } M = 1 \text{ or } 2 \\ Y & \text{if } M > 2 \end{cases}$$

$$m' = \begin{cases} M + 13 & \text{if } M = 1 \text{ or } 2 \\ M + 1 & \text{if } M > 2. \end{cases}$$

Then days between dates is found by

$$Days = Day\ \#2 - Day\ \#1$$

To compute the date from a day number:

$$\begin{aligned} Day\# &= JD_{\text{ADJ.}} + 478164 \\ y' &= \text{INT}((Day\# - 121.5)/365.2425) \\ m' &= \text{INT}((Day\# - \text{INT}(365.25y') + \text{INT}(y'/100) \\ &\quad - \text{INT}(y'/400))/30.6001) \end{aligned}$$

$$\begin{aligned} \textit{Day of month} &= \textit{Day\#} - \text{INT}(365.25y') + \text{INT}(y'/100) \\ &\quad -\text{INT}(y'/400) - \text{INT}(30.6001m') \\ \textit{MONTH} &= m = m' - 13 \quad \text{if } m' = 14 \text{ or } 15 \\ &\qquad\quad m' - 1 \quad \text{if } m' < 14 \\ \textit{YEAR} &= y' \quad \text{if } m > 2 \\ &\qquad\quad y' + 1 \quad \text{if } m = 1 \text{ or } 2 \end{aligned}$$

To compute week days between dates.

$$W(m,d,y) = 5*\text{INT}\,(D(m,d,y)/7) + .5*\text{INT}(1.801*(D(m,d,y) \bmod 7))$$

where

$$\begin{aligned} D(m,d,y) &= d - \text{INT}(.75\text{INT}(g(y,m)/100)-7) \\ &\quad + \text{INT}(365.25\,g(y,m)) + \text{INT}(30.6f(m)) \\ f(m) &= \begin{cases} m + 13 & \text{if } m = 1,2 \\ m + 1 & \text{if } m > 2 \end{cases} \\ g(y,m) &= \begin{cases} y - 1 & \text{if } m = 1,2 \\ y & \text{if } m > 2 \end{cases} \end{aligned}$$

W is the number of weekdays since a certain fixed date in antiquity. The number of weekdays between two dates is then the difference between the values of W.

To compute day of the week:

$$\textit{Day of the week} = 7 \times \text{FP}((\textit{Day\#} + 5)/7)$$

To compute day of the year:

$$\textit{Day of year} = JD_{\text{ADJ}} - JD_{\text{ADJ}}\,(\textit{January 1, Year}) + 1$$

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "CALEND"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation is displayed, go to step 4.

   OR:

   a. Press: KEY #1 (D1/D2), to enter two dates for computing days between them (KEY #2) or weekdays between them (KEY #6).
   b. Go to step 5.

   OR:

a. Press: KEY #2 (Δ DAYS), if two dates have already been entered and the number of days between them is desired.
b. After the number of days is displayed, go to step 4.

OR:

a. Press: **KEY #3** (DT+DAYS), to compute a date N-days before or after an entered date.
b. Go to step 7.

OR:

a. Press: KEY #4 (DOW/DOY) to compute the day of week and day of year of a date.
b. Go to step 10.

OR:

a. Press: KEY #6 (ΔW. DAYS), if two dates have already been entered and the number of weekdays between them is desired.
b. After the number of weekdays is displayed, go to step 4.

a. Press: KEY #8 (PRT-CAL), if a calendar for a particular month and year is desired.
b. Go to step 12.

Note: If NO DATES ENTERED is displayed, go to step 4.

OR:

5. When ENTER FIRST DATE: MM.DDYYYY? is displayed:
   a. Enter: The date as specified, e.g., April 6, 1978 would be entered as 4.061978.
   b. Press: (END LINE)

   Note: If INVALID DATE is displayed, the date must be re-entered. Go to step 5.
6. When ENTER SECOND DATE: MM.DDYYYY? is displayed:
   a. Enter: The second date.
   b. Press: (END LINE)
   c. Go to step 4.

   Note: If INVALID DATE is displayed, go to step 6 and re-enter date.
7. When ENTER DATE: MM.DDYYYY? is displayed:
   a. Enter: The date as specified, e.g., April 6, 1978 would be entered as 4.061978.
   b. Press: (END LINE)

   Note: If INVALID DATE is displayed, go to step 7 and re-enter date.
8. When ENTER DAYS BETWEEN DATES '-' IMPLIES BEFORE? is displayed:
   a. Enter: The number of days. Negative values will indicate that the unknown date is before the known date.
   b. Press: (END LINE)

   Note: If DATE IS OUT OF RANGE is displayed the resulting date is out of range. Go to step 8.
9. After the resulting date is displayed, go to step 4.
10. When ENTER DATE: MM.DDYYYY? is displayed:
    a. Enter: The date as specified, e.g., April 6, 1978 would be 4.061978.
    b. Press: (END LINE)

    Note: If INVALID DATE is displayed, go to step 10 and re-enter date.
11. After the day-of-week and day-of-year is displayed, go to step 4.
12. When MONTH,YEAR=? is displayed:
    a. Enter: The month and year separated by a comma, e.g., April 1978 would be entered as 4,1978.
    b. Press: (END LINE)

    Note: If GREGORIAN CALENDAR BEGINS, 1753 or WHAT MONTH IS_TRY AGAIN is displayed, go to step 12 and re-enter month and year.

    Note: If the year is two digits, the program will add 1900 automatically.

13. When ENTER HEADING? is displayed:
    a. Enter: The heading for the calendar. The maximum number of characters in the heading is 32.
    b. Press: (END LINE)

    Note: If no heading is desired, enter a blank.

14. After the plot is finished:
    a. Press: (COPY) to get another copy on the printer.
    b. Go to step 4 when the copy is finished.

    OR:

    a. Go to step 4.

Example 1:

Bjorn Borg won his first Wimbledon singles championship on July 3, 1976 and his third singles championship on July 8, 1978. How many days had passed between his first win and his third win? How many of these days were week days? Generate a calendar for July 1978.

```
NUMBER OF DAYS BETWEEN
 7.031976 AND  7.081978 IS
 735  DAYS

NUMBER OF WEEKDAYS BETWEEN
 7.031976 AND  7.081978 IS
525 DAYS.
```

EXAMPLE CALENDAR
JULY 1978

SUN	MON	TUE	WED	THU	FRI	SAT
						1
2	3	4	5	6	7	8
9	10	11	12	13	14	15
16	17	18	19	20	21	22
23 / 30	24 / 31	25	26	27	28	29

Example 2:

An individual received a bill dated July 10, 1978. If the bill must be paid in 30 days, what is this date and what day of the week is it?

```
ENTER DATE:MM.DDYYYY
?
7.101978
ENTER DAYS BETWEEN DATES
'-' IMPLIES BEFORE
?
30
RESULTING DATE IS  8.091978
ENTER DATE:MM.DDYYYY
?
8.091978
WEDNESDAY
AND DAY NO.  221  OF THE YEAR
```

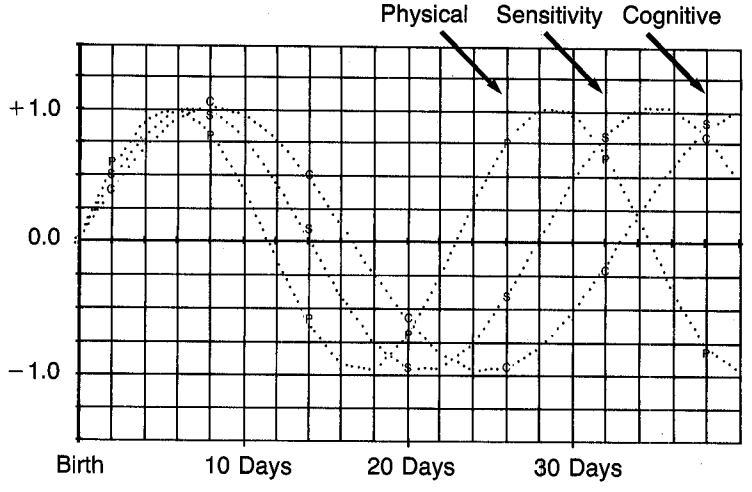
Notes

Biorhythms

From the ancient of days, philosophers and sages have taught that human happiness lies in the harmonious integration of body, mind, and heart. Now a twentieth-century theory claims to be able to quantitatively gauge the functioning of these three aspects of ourselves: the physical, sensitive, and cognitive.

The biorhythm theory is based on the assumption that the human body has inner clocks or metabolic rhythms with constant cycle times. Currently, three cycles starting at birth in a positive direction are postulated. The 23-day or physical cycle relates with physical vitality, endurance and energy. The 28-day or sensitivity cycle relates with sensitivity, intuition and cheerfulness. The 33-day or cognitive cycle relates with mental alertness and judgement.

For each cycle a day is considered either high, low or critical. The high ($0 < x \leq 1$) times are regarded as energetic times, you are your most dynamic in the cycle. The low ($-1 \leq x < 0$) times are regarded as the recuperative periods. The critical days ($x = 0$) are regarded as your accident prone days especially for the physical and sensitivity cycles.



This program will plot the biorhythms for a month at a time. The critical days during the 33-day period from an entered date can also be printed.

Operating Limits and Warnings:

The birthday and bio-date must occur between October 15, 1582 through November 25, 4046.

The date format for input is MM.DDYYYY (May 4, 1978 is entered as 5.041978). The program does not exhaustively check the date for validity. Thus, if an improper format or an invalid date (e.g., February 29, 1978) is entered, erroneous answers will result.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "BIORHY"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation of the program.
   b. After the explanation is displayed, go to step 4.
   OR:
   a. Press: KEY #1 (ENTER) to enter birthdate and name.
   b. Go to step 5.
   OR:
   a. Press: KEY #6 (EXPLAIN), if you need an explanation of biorhythms printed.
   b. After the explanation is printed, go to step 4.
5. When ENTER YOUR NAME? is displayed:
   a. Enter: Your name in 32 characters or less.
   b. Press: (END LINE)
6. When WHAT IS YOUR BIRTHDAY: MM.DDYYYY? is displayed:
   a. Enter: Your birthday in the specified format, e.g., May 4, 1974 would be entered as 5.041974.
   b. Press: (END LINE)
   c. Go to step 7.
   Note: If INVALID DATE is displayed, go to step 6.
7. After the birthdate has been entered:
   a. Press: KEY #2 (CRIT. DY) to obtain the critical days during a 33-day period after a date.
   b. Go to step 8.
   OR:
   a. Press: KEY #4 (PLOT) to plot the biorhythms for a given month.
   b. Go to step 11.
   OR:
   a. Go to step 4 for another person or explanations.
8. When ENTER STARTING DATE: MM.DDYYYY? is displayed:
   a. Enter: The first date for checking for critical days in the specified form, e.g., May 4, 1974 would be entered as 5.041974.
   b. Press: (END LINE)
9. If INVALID DATE or YOU CANNOT GO BACK__ is displayed, go to step 8 and re-enter the starting date.
10. After the critical days are displayed, go to step 7.
11. When ENTER MONTH/YEAR: MM.YYYY? is displayed:
   a. Enter: The month and year in the specified form, e.g., May, 1978 would be entered as 5.1978.
   b. Press: (END LINE)
12. If INVALID DATE or SPECIFIED MONTH IS BEFORE BIRTHDAY is displayed, go to step 11 and re-enter the month and year.
13. After the plot is finished and COPY TO PRINTER: Y/N? is displayed:
   a. Enter: Y, if you want a copy of the plot.
   b. Press: (END LINE)
   OR:
   a. Enter: N, if you do not want a copy.
   b. Press: (END LINE)
   Note: You must enter either "Y" or "N" or the program will beep and go to step 13.
14. After viewing the plot:

a. Press: (CONT), when you are ready to proceed.

15. When NEXT MONTH:Y/N? is displayed:
a. Enter: Y, if you want a plot of the next month.
b. Press: (END LINE)
c. Go to step 13.
OR:
a. Enter: N, if the next month is not to be plotted.
b. Press: (END LINE)
c. Go to step 7 after pressing (KEY LABEL).

Example 1:

Steve Cauthen was born on May 1, 1960 and Jorge Velasquez was born on December 27, 1946. The triple crown races in 1978, Kentucky Derby, Preakness, and Belmont Stakes, were run on May 6, May 20, and June 10 respectively. Generate the critical days for the months of May and June for both jockeys. By looking at the biorhythms for the race days, there might be something about the cycles that resulted in Affirmed winning.

Timer

This program is a collection of routines that implement various timing functions available to the user. The program contains five different timers:

1. Five-second timer
2. Count-Up timer with splits
3. Count-Down timer
4. Digital Clock timer
5. Clock with chimes

The timers are not accurate enough to be used for extended periods of time over more than a few hours. The main intention of these routines is to provide you with example timing routines for your own use. The clock with chimes is included more as a novelty than to be used in your own applications.

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "TIMER"
   b. Press: (END LINE)
3. To run the program:
   a. Press: (RUN)

   Note: PROGRAM BEING INITIALIZED will be displayed.
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the explanation has been displayed, go to step 4.

   OR:

   a. Press: KEY #1 (SET/STOP) to set the time.
   b. Go to step 5 to enter the time and specify form of display.

   OR:

   a. Press: KEY #3 (CNT UP) to select the count up timer with split capability.
   b. Go to step 10.

   OR:

   a. Press: KEY #7 (CNT DWN) to select the count down timer.
   b. Go to step 12.
5. When ENTER TIME:HH.MMSS? is displayed:
   a. Enter: The time for setting the clock.
   b. Press: (END LINE)

   Note: 1:31 P.M. would be entered as 13.3100

   OR:

   a. Enter: −1, if the time has been set.
   b. Press: (END LINE)

   Note: If INVALID TIME is displayed, go to step 5.
6. When PRESS CONT TO SET TIME is displayed:
   a. Press: (CONT) when the time is to be set.
7. To specify the display format:

a. Press: KEY #2 (DIGITAL) to specify the digital clock format.
b. Go to step 8.
OR:
a. Press: KEY #6 (CLOCK) to select the graphical clock with chimes.
b. Go to step 8.
OR:
a. Press: KEY #8 (5-SEC) to specify the five-second display mode.
b. Go to step 8.

Note: If TIME NOT SET is displayed, go to step 4.

8. To stop the output of the time, press KEY #1 (SET/STOP).

9. To display the time:
a. Press: KEY #2 (DIGITAL) for digital clock format.
b. Go to step 8.
OR:
a. Press: KEY #6 (CLOCK) for the clock with chimes.
b. Go to step 8.
OR:
a. Press: KEY #8 (5-SEC) for time update every five seconds.
b. Go to step 8.
OR:
a. Go to step 4 to change the timing operation.

10. When PRESS CONT WHEN READY is displayed:
a. Press: (CONT), when you are ready to start the count up timer.
b. Go to step 11 to take splits or stop the time.

11. To take splits:
a. Press: KEY #4 (SPLIT) to store the current time since starting the timer.
b. Go to step 11.

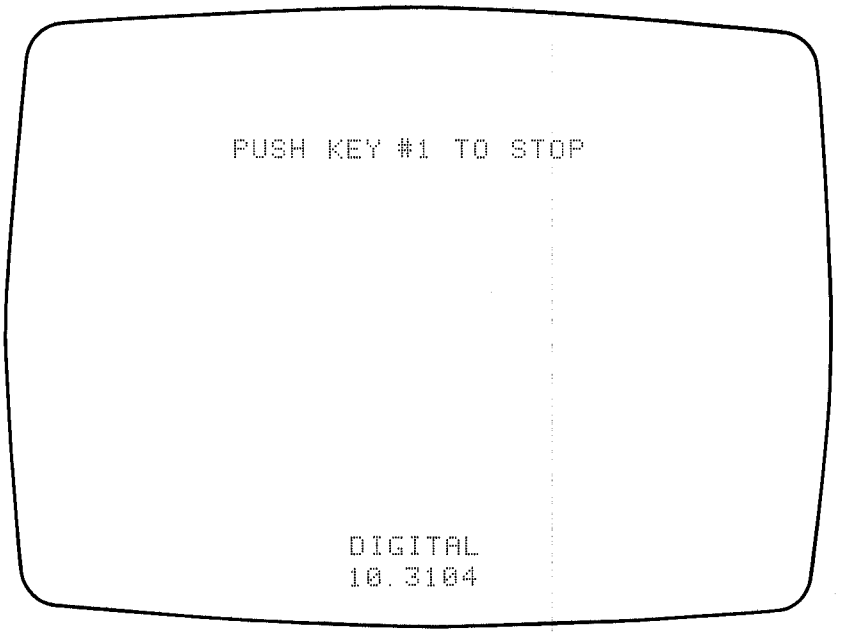
Note: Up to 100 splits can be taken and retained.
OR:
a. Press: KEY #1 (SET/STOP) to stop the timer and store this as the last split.
b. Press: KEY #4 (SPLIT) to print out the split values.
c. Go to step 4 to select the timing operation.

12. When ENTER COUNT DOWN SECONDS? is displayed:
a. Enter: The number of seconds for the count down.
b. Press: (END LINE)

13. When PRESS CONT WHEN READY is displayed:
a. Press: (CONT), when ready to start the count down.
b. Go to step 4 to select the timing operation when finished.

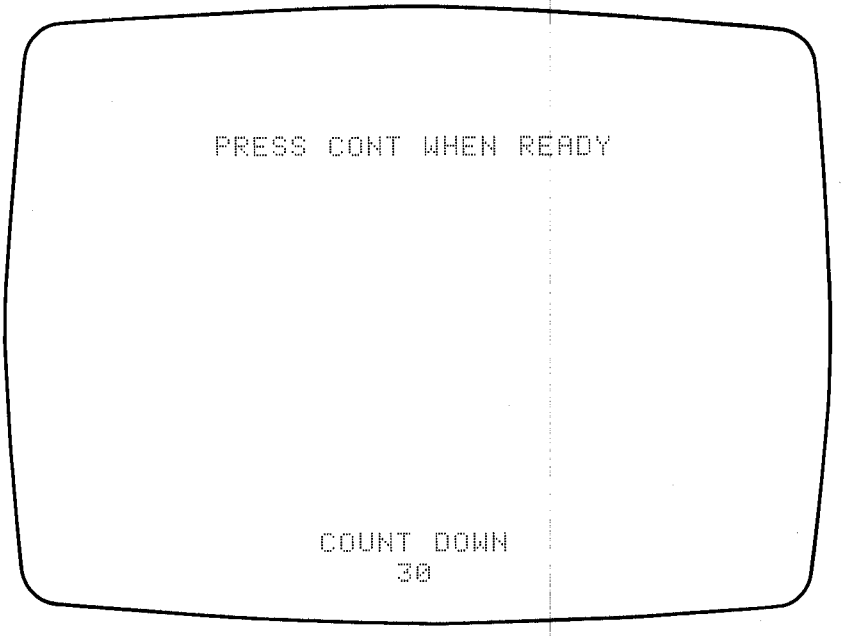
Example 1:

Set the time to 10:3100 and specify the digital clock format. After starting the display, stop the time output.



Example 2:

Set the count down timer for a count down of 30 seconds and then start it.



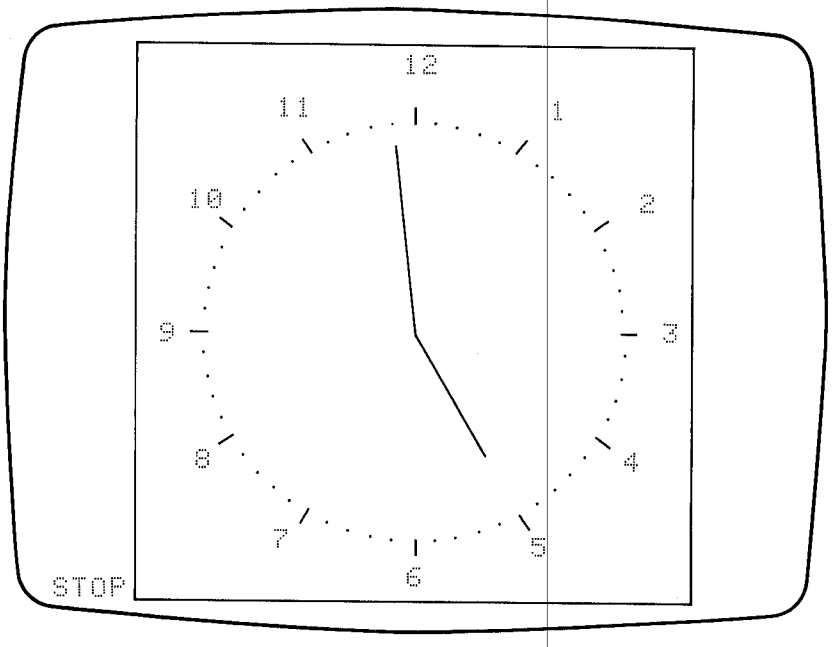
Example 3:

Start the count up timer and take 5 splits. The fifth split should be taken by stopping the timer using KEY #1. After taking the splits, print out the split values.

```
SPLIT#      ΔTIME SEC
   1              .7460
   2             1.5860
   3             2.3530
   4             3.1290
   5             4.0370
```

Example 4:

Set up and start the clock with chimes for 4:59.



Music Composer

This program is designed to enable you to create, edit, store, output and play music composed of single notes using the internal speaker and the programmable BEEP command. The tones which are generated cover a range of six octaves starting from 55 cps (A). Using the composing symbols recognized by this program, you can specify the note, e.g., A, B, C, etc., the octave, the timing, e.g., eighth, quarter, etc., a rest, repeat of a passage, and the metronome setting, i.e., number of whole beats/minute. The natural notes are entered as the capital letters A through G. Flats are lower case letters a through g. Sharps are entered using the CONTROL key and the capital letters A through G, which generates the characters ¿, $\bar{x}$, $\bar{N}$, α, β, Γ, and $\bar{n}$ for A#, B#, C#, D#, E#, F#, and G# respectively.

The result of parsing the entered composition is a numeric array which contains BEEP parameters and codes which specify rests, repeats, and metronome timing changes.

While the tonal quality is not exceptional, this program can be used as an example of parse techniques which are often useful to know. After becoming familiar with the program, you should be able to add your own customized routines. The example tune has been selected to demonstrate some of the capabilities of this program and the type of music performable by the machine.

Enjoy your machine—play some music for your friends!

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "COMPZR"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled and SELECT OPTION is displayed:
   a. Press: KEY #5 (HELP), if you need a more detailed explanation.
   b. After the key explanation is displayed, press (CONT) for the explanation of the composition symbols.
   c. After the example theme is played, go to step 4.
   OR:
   a. Press: KEY #1 (CREATE), to enter the composition.
   b. Go to step 5.
5. When OLD OR NEW TUNE : O/N? is displayed:
   a. Enter: O, if the tune is stored on tape.
   b. Press: (END LINE)
   c. Go to step 6.
   OR:
   a. Enter: N, if the tune is to be entered from the keyboard.
   b. Press: (END LINE)
   c. Go to step 7.

   Note: You must enter either "O" or "N" or the program will beep and go to step 5.
6. When FILE NAME? is displayed:
   a. Enter: The name of the file on the tape.
   b. Press: (END LINE)

c. After the array is loaded, go to step 15.

Note: If an error occurs during the load the program will go to step 6.

7. When METRONOME? is displayed:
   a. Enter: The number of whole notes per minute.
   b. Press: (END LINE)
8. When REVIEW:Y/N? is displayed:
   a. Enter: Y, if you want the option of rejecting an input string after it is parsed.
   b. Press: (END LINE)

   OR:

   a. Enter: N, if any acceptable input will be stored.
   b. Press: (END LINE)

   Note: You must enter either "Y" or "N" or the program will beep and go to step 8.

   Note: If you turn down the review option, corrections may be difficult.
9. When COMPOSITION? is displayed:
   a. Enter: The encoded music as a string input, maximum 96 characters per entry.
   b. Press: (END LINE)

   OR:

   a. Type: END, to terminate entry.
   b. Press: (END LINE)
   c. Go to step 15.

   Note: Use the following codes as given in the HELP section to enter the composition.

```
        COMPOSING SYMBOLS
Naturals→ABCDEFG
Flats→abcdefg
Sharps→CTRL ABCDEFG or
   ¿%ÑαßΓΠ

Octave→On, 1<=n<=6
Timing→Tn/m or Tm if n=1
Rest→R, uses current timing
Repeat→:n/m or :n if m=0
      n=# ARRAY VALUES TO
        REPEAT
      m=# ARRAY VALUES TO
        SKIP
Metronome→Mn, n=Whole
   Notes/Min.
DEFAULT VALUES→O4T1
   EX:M60O3T8GO4CET4GT
   8RET2G
```

   Note: In addition to notes, the numeric array which is created, contains codes for rests, repeats, and metronome timing changes. The repeat parameters, n and m, must include all array locations which are repeated and/or skipped. The optional second parameter, m, can be used to specify a second ending to a repeated passage. The value of m is the number of array values in the first ending which will be skipped. The second ending will start at the next array location after the repeat.
10. If ?__AT__ is displayed, go to step 14.
11. If the review option was specified and OK:Y/N? is displayed:
    a. Enter: Y, if the entry is correct.
    b. Press: (END LINE)
    c. Go to step 12.

    OR:

    a. Enter: N, if you want to re-enter this entry with changes.
    b. Press: (END LINE)
    c. Go to step 14.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 11.
12. Repeat steps 9—11 until the composition is entered.
13. Go to step 15.
14. When RE-ENTER? is displayed:
    a. Enter: The composition.
    b. Press: (END LINE)
    c. Go to step 10.

    Note: The easiest method is to edit the previous entry using the editing features of your computer.
15. When DONE has been displayed:

a. Press: KEY #2 (CHANGE), if either the overall timing of the piece or individual notes need to be changed.
b. Go to step 16.
OR:
a. Press: KEY #3 (STORE), to store the composed array.
b. Go to step 28.
OR:
a. Press: KEY #4 (PLAY), to play the composed array.
b. After END PERFORMANCE is displayed, go to step 15 or step 4 to enter a new tune.
OR:
a. Press: KEY #6 (DELETE), to delete array elements.
b. Go to step 32.
OR:
a. Press: KEY #7 (INSERT), to insert notes in the array.
b. Go to step 35.
OR:
a. Press: KEY #8 (PRINT), to print out the contents of the array using composing symbols or plot the score.
b. Go to step 44.

16. When CHANGE TIMING: Y/N? is displayed:
a. Enter: Y, if the timing of the entire array is to be changed.
b. Press: (END LINE)
c. Go to step 17.
OR:
a. Enter: N, if the timing is correct.
b. Press: (END LINE)
c. Go to step 18.
Note: You must enter either "Y" or "N" or the program will beep and go to step 16.

17. When METRONOME? is displayed:
a. Enter: The new metronome setting.
b. Press: (END LINE)
Note: If a negative or zero value is entered, the program will go to step 18 and not change the array values.

18. When CHANGE NOTES: Y/N? is displayed:
a. Enter: Y, if you want to change any array values.
b. Press: (END LINE)
c. Go to step 19.
OR:
a. Enter: N, if no changes are needed.
b. Press: (END LINE)
c. Go to step 15 or step 4 to enter a new tune.
Note: You must enter either "Y" or "N" or the program will beep and go to step 18.

19. When REVIEW: Y/N? is displayed:
a. Enter: Y, if you want the option of rejecting an input string after it is parsed.
b. Press: (END LINE)
OR:
a. Enter: N, if any acceptable input will be stored.
b. Press: (END LINE)
Note: You must enter either "Y" or "N" or the program will beep and go to step 19.
Note: If you turn down the review option, corrections may be difficult.

20. When NOTE #? is displayed:
a. Enter: The index of the note or array element to change.
b. Press: (END LINE)

21. When SET TIMING: Y/N? is displayed:
a. Enter: Y, if the array is to be checked for timing changes so that the note timing can be determined accurately.
b. Press: (END LINE)
OR:
a. Enter: N, if the timing has not been changed or the current timing of the note to be changed is not important.
b. Press: (END LINE)

Note: You must enter either "Y" or "N" or the program will beep and go to step 21.

22. If the current array contents are printed and METRONOME? is displayed:
    a. Enter: The new metronome setting.
    b. Press: (END LINE)
    c. Go to step 26.

    Note: If a negative or zero value is entered, the program will go to step 26 and not change the array values.

23. If the current array contents are printed and NEW NOTE? is displayed:
    a. Enter: The new encoded string.
    b. Press: (END LINE)

    OR:

    a. Enter: OK, if the note is correct.
    b. Press: (END LINE)
    c. Go to step 26.

24. If ?_AT_ is displayed, go to step 27.

25. If the review option was specified and OK : Y/N? is displayed:
    a. Enter: Y, if the entry is correct.
    b. Press: (END LINE)
    c. Go to step 26.

    OR:

    a. Enter: N, if you want to re-enter this entry with changes.
    b. Press: (END LINE)
    c. Go to step 27.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 25.

26. When MORE : Y/N? is displayed:
    a. Enter: Y, if there are more changes.
    b. Press: (END LINE)
    c. Go to step 20.

    OR:

    a. Enter: N, if there are no more changes.
    b. Press: (END LINE)
    c. Go to step 15 or step 4 to enter a new tune.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 26.

27. When RE-ENTER? is displayed:
    a. Enter: The composition.
    b. Press: (END LINE)
    c. Go to step 23.

    Note: The easiest method is to edit the previous entry using the editing features of your computer.

28. If NO TUNE! is displayed, a tune must be entered first, therefore, go to step 4.

29. When FILE NAME? is displayed:
    a. Enter: The name of the file.
    b. Press: (END LINE)

30. When CREATE : Y/N? is displayed:
    a. Enter: Y, if the file must be created.
    b. Press: (END LINE)

    OR:

    a. Enter: N, if the file already exists.
    b. Press: (END LINE)

    Note: You must enter either "Y" or "N" or the program will beep and go to step 30.

31 When DONE is displayed, go to step 15 or step 4 to enter a new tune.

32. When DELETE STARTING AT? is displayed:
    a. Enter: The number of the first note to be deleted.
    b. Press: (END LINE)

    Note: If the value is less than or equal to 0, go to step 15.

33. When HOW MANY? is displayed:
    a. Enter: The number of notes to be deleted.
    b. Press: (END LINE)

    Note: If the value is equal to zero or greater than the number of notes in the composition, go to step 15.

34. When DONE is displayed, go to step 15.

35. When INSERT NOTES AFTER? is displayed:
    a. Enter: The number of the note before the inserted note(s).
    b. Press: (END LINE)

Note: If -1 is entered, go to step 15.

Note: If N, the current number of notes, is entered, go to step 8 to add notes to the end.

Note: If the value is greater than the number of notes in the machine, go to step 34 and re-enter.

36. When HOW MANY? is displayed:
    a. Enter: The number of notes or array elements to be inserted.
    b. Press: (END LINE)

    Note: If 0 is entered, go to step 15.
37. If TOO MANY MAX.IS__ is displayed, go to step 36 and enter a smaller number.
38. When REVIEW:Y/N? is displayed:
    a. Enter: Y, if you want the option of rejecting an input string after it is parsed.
    b. Press: (END LINE)

    OR:

    a. Enter: N, if any acceptable input will be stored.
    b. Press: (END LINE)

    Note: You must enter either "Y" or "N" or the program will beep and go to step 38.

    Note: If you turn down the review option, corrections may be difficult.
39. When COMPOSITION? is displayed:
    a. Enter: The composition.
    b. Press: (END LINE)
40. If ?__AT__ is displayed:
    a. Enter: The correct character(s).
    b. Press: (END LINE)
41. If the review option was specified and OK:Y/N? is displayed:
    a. Enter: Y, if the entry is correct.
    b. Press: (END LINE)
    c. Go to step 42.

    OR:

    a. Enter: N, if you want to re-enter this entry with changes.
    b. Press: (END LINE)
    c. Go to step 43.

    Note: You must enter either "Y" or "N" or the program will beep and go to step 41.
42. When DONE is displayed, go to step 15.
43. When RE-ENTER? is displayed:
    a. Enter: The composition.
    b. Press: (END LINE)
    c. Go to step 40.

    Note: The easiest method is to edit the previous entry using the editing features of your computer.
44. When 1ST VALUE? is displayed:
    a. Enter: The index of the first value.
    b. Press: (END LINE)

    Note: If 0 is entered, go to step 15.
45. When LAST VALUE? is displayed:
    a. Enter: The index of the last value.
    b. Press: (END LINE)

    Note: If these values are not valid, go to step 44 and re-enter.
46. When PRINT OR SCORE:P/S? is displayed:
    a. Enter: P, if the notes are to be printed using composing symbols.
    b. Press: (END LINE)

    OR:

    a. Enter: S, if the notes are to be plotted using musical notation.
    b. Press: (END LINE)

    Note: You must enter either "P" or "S" or the program will beep and go to step 46.
47. When DONE is displayed or the final page of the score has been copied, go to step 15.

Example 1:

Using the example tune which is stored on the Standard Pac cartridge as the data file, "MUSIC", create and play this tune. After playing the tune, plot the first 20 array values using the score option.

If the print option had been specified, the following would result.

```
NOTES FROM  1  TO  20
T403G R.152 T1603G T1603G T403G
R.152 T1603G T1603G T803G T803E
T803C T803E T803G T803E T803G
T804C T803G T803E T803C T803E
```

Note that the rests also take up array locations.

Example 2:

Using the data shown below, enter the tune and then play it. After playing it, change the metronome setting to 30 and play it again.

Metronome setting = 60

Tune Data

```
T8EET2GT8EET2GT8EG05T4CBAA
T3/804GT8DET4FDT8DET4FDT8
DF05BA04T4G05BT3/4C
```

Ski Game

This game simulates skiing through a slalom course. The user has control of motion to the left and right, but the downward motion is determined by the machine. The course is generated by the machine, but is based on input by you so that you can repeat the same course later if you wish. Your running time will be displayed as you descend through the gates.

The object of the game is to make it through all the gates in the least amount of time. If you go through a gate, an audible signal will be made. If you hit a pole, the pole will fall over, but you still have been credited with making it through the gate. If you drop below a gate, there is no way for you to recover on this run, but you can continue and try to make the remaining gates and check your time. You are able to specify your ability at the start of the game. This value is used to determine the speed down the slope. Therefore, your time will be faster as your ability increases, but your ability to control your motion will decrease as your ability level increases. Another aspect of the game, which you should notice after playing a few times is the effect of turning on the speed down the slope. The more you turn, the slower you will move down the slope, but if you don't turn, the downward speed will be increased by the machine. Finally, you are able to specify the background color as black or white to suit your own visual sense.

The functions used to simulate the motion were derived for this game and have no direct correspondence to actual equations of motion. Have fun skiing!

User Instructions

1. Insert the Standard Pac cartridge into the tape transport.
2. To load the program:
   a. Type: (REW LOAD) "SKI"
   b. Press: (END LINE)
3. To start the program:
   a. Press: (RUN)
4. When the keys are labelled:
   a. Press: KEY #1 (SET UP) to start the game and set up the course.
   b. Go to step 5.
   OR:
   a. Press: KEY #5 (HELP), if you need an explanation of the game.
   b. After the explanation is printed, go to step 4.
5. When ENTER BACKGROUND COLOR: 0=W, 1=B? appears in the display:
   a. Enter: 0, if the desired background color is white.
   b. Press: (END LINE)
   OR:
   a. Enter: 1, if the desired background color is black.
   b. Press: (END LINE)

   Note: Entering any value other than 0 will result in a black background.
6. When ENTER COURSE CODE? appears in the display:
   a. Enter: The course code (any number is

acceptable, but integers in the range of 1 to 999999 are preferable.

b. Press: END LINE

7. When WHAT'S YOUR ABILITY:
1 TO 5
(1 IS EASY, 5 IS HARD)?
appears in the display:
   a. Enter: Your ability level.
   b. Press: END LINE

   Note: Values less than 1 will be rejected, but values greater than 5 will be accepted.

8. After the course is displayed and START is blinking:
   a. Press: KEY #2 (START) when you are ready to start skiing.
   b. There will be an audible sequence before the dot appears in the starting gate.

9. To increment the velocity component in the left direction:
   a. Press: KEY #3 (LEFT)

   Note: Do not hold key down!

10. To increment the velocity component in the right direction:
   a. Press: KEY #4 (RIGHT)

   Note: Do not hold key down!

11. Repeat steps 9 and 10 as needed until you are below the finish gate.

12. After the final time is printed and any missed gates are labelled, select the next option:
   a. Press: KEY #8 (REPEAT) if you want to repeat the same course with the same ability level.
   b. Go to step 8.

   OR:

   a. Press: KEY #2 (START) if you want to stop the game or set up a new course.

13. When TRY AGAIN: YES/NO?
appears in the display:
   a. Enter: Y, if you want to try again.
   b. Press: END LINE

   OR:

   a. Enter: N, if you want to stop.
   b. Press: END LINE
   c. The program ends.

   Note: You must enter either "Y" or "N" or the program will beep and go to step 13.

14. When NEW COURSE: YES/NO?
appears in the display:
   a. Enter: Y, if you want to specify a different course.
   b. Press: END LINE
   c. Go to step 5.

   OR:

   a. Enter: N, if you only want to change your ability level.
   b. Press: END LINE
   c. Go to step 7.

   Note: You must enter either "Y" or "N" or the program will beep and go to step 14.

Example:

The following is an example run using black background, a course code of 52249 and an ability level of 3. Try your skill on the same course.

Program Documentation and Programming Techniques

Program

Moving Average

Circular List

The efficient use of data in a computer is directly related to the choice of data structure used to store the information. While it would be beneficial to the user to have a detailed explanation of data structures here, it would require far more space than this entire book to properly cover the subject. Instead, the data structure used in the "Moving Average" program will be explained.

A circular list was employed to store the retained values. The first 200 elements of the array, A, are allotted to the circular list. The element A(201) contains the index of the next available location in the array for storing data. The array elements A(202) and A(203) contain pointers to the oldest and newest entries respectively. These pointers are used to traverse the array from oldest to newest values or vice versa. The number of points to be retained is stored in A(204). Since there is no need for inserting or deleting values once they have been entered, the array structure used in this program departs from the actual definition of a circular list since there are no pointers stored with the data elements. The index of the array element is used as a pointer in this example. Following through a few operations on this structure should help your understanding of how the pointers are used.

Lines 610 through 660 control the addition of a point onto the end of this list.

```
610 A(A(201))=T

620 A(203)=A(201)

630 A(201)=A(201)*(A(201)
    <A(204))+1

640 IF A(201)=1 THEN A(202)=
    1 @ GOTO 570

650 IF A(203)=A(202) THEN
    A(202)=A(201)

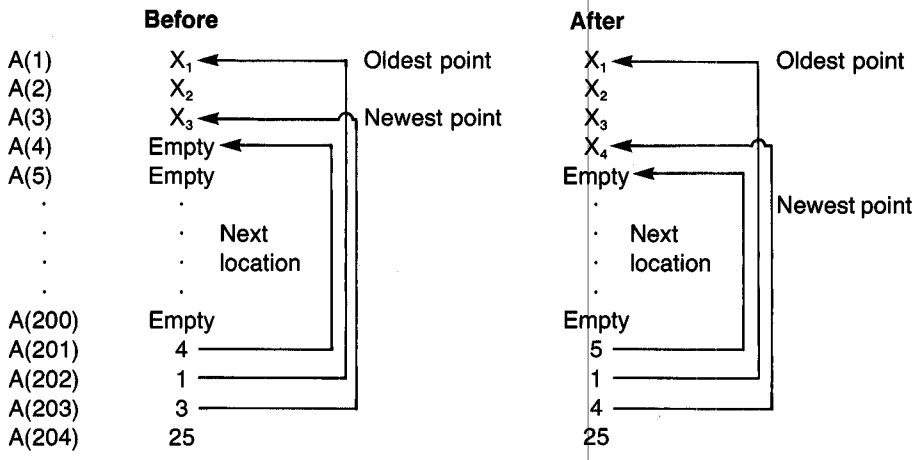
660 GOTO 570
```

New Value→ A (next available location)

Next available location→ location of last entered value
Location of last entered value + 1 → next available location, unless location of last entered value equaled the number of retained values when the next available location is set to 1.

Set oldest value if it is the first entry or it is changed

If we examine the contents of the array before and after the 4th point is entered, this process should be clearer. For this example, assume that 25 points are to be retained.



As you can see the pointers were changed after the fourth point was entered.

Variable Definitions

A[ ] – Circular list containing entered values and list pointers
A$ – Response string
B[ ] – Averages
V$ – Label
A – Number of points in average
D1 – Distance of a dot in x-direction
D2 – Distance of a dot in y-direction
E – Position of "E" in string
F – Plot flag
F1 – Print averages flag
G9 – Temporary
I – Loop counter and temporary
J – List pointer used in traversing the list
J1 – List pointer used in traversing the list
L – Label length
L1 – Number of X-axis intervals
L2 – Number of Y-axis intervals
L3 – Number of X-intervals between labels
L4 – Number of Y-intervals between labels
L9 – Label position

M1 – Axis Y-minimum
M2 – Axis Y-maximum
M3 – Number of retained values
P – Temporary pointer
S – Sum
S7 – Y-label flag
S8 – X-label flag
S9 – Vertical/Horizontal label flag
T – Average temporary
U – Count of values in sum
V – Length of label
W – Temporary for label
W1 – Temporary for label
X – Label position and temporary
X0 – Scale X-minimum
Y – Label position
Y0 – Scale Y-minimum
Z1 – M3−1
Z2 – M2−M1
Z3 – X dot range
Z4 – Y dot range
Z5 – Scale X-maximum

Notes

Annuities and Compound Amounts with Amortization

Interchangable Solutions

In programs like ''Annuities and Compound Amounts with Amortization'', it is necessary to be able to calculate any value given the other values. In this program, known values are entered by pressing the key designating the known value (e.g., KEY #1 for entering the number of compounding periods, *n*) and then entering the value when requested. The unknown value is then specified by first pressing KEY #7 (SLV/AD) followed by the key designating the unknown value (e.g., KEY #4 for periodic payment, PMT). Pressing KEY #7 sets the value of the variable *S* to 6 which indicates that the next key pressed will designate the unknown value to be calculated and printed. A closer look at the actual program should clarify this technique. The essential lines which show the control logic are shown below:

```
 80 V1,V2,P,N,J1,J=0
 90 ON KEY# 1,"n" GOSUB 220
100 ON KEY# 2,"i" GOSUB 240
110 ON KEY# 3,"PV" GOSUB 280
120 ON KEY# 4,"PMT" GOSUB 260
130 ON KEY# 5,"HELP" GOSUB 340
140 ON KEY# 6,"AMORT" GOSUB 300
150 ON KEY# 7,"SLV/AD" GOSUB 480
160 ON KEY# 8,"FV" GOSUB 320
170 KEY LABEL
180 DISP "SELECT OPTION"
190 F,S=0 @ A=1
200 ON S+F+1 GOTO 200,560,600,66
    0,690,720,200,750,810,1070,1
    130,1180,210
210 GOTO 1230
220 F=1
230 RETURN
240 F=2
250 RETURN
260 F=3
270 RETURN
280 F=4
290 RETURN
```

```
300 F=12 @ S=0
310 RETURN
320 F=5
330 RETURN
```

The variable *F* is used to specify which key has been pressed. The variable *S* indicates whether the solve key has been pressed. A trace of the program will show the flow of execution in solving for the periodic payment (PMT) after the known values were entered.

This technique, while being rather complicated, is quite versatile and powerful when implemented in programs which require the user to select the flow of operations.

```
 Trace line 200 to 200
 Trace line 200 to 200
 Trace line 200 to 260
 Trace line 270 to 200
 Trace line 200 to 1070
PERIODIC PAYMENT =-224.03
 Trace line 1120 to 180
 Trace line 200 to 200
 Trace line 200 to 200
```

Variable Definitions

A$ – Response string
A – Annuity due/ordinary annuity flag
A1 – Temporary = 1 + A * J
F – Key pressed code
F1 – Temporary
I – Loop counter and temporary
J – Periodic interest rate
J1 – Annual interest rate
N – Number of compounding periods
N1 – Number of compounding periods/year
P – Periodic payment
P1 – Starting period for amortization
P2 – Ending period for amortization
R – Temporary
R8 – Temporary
R9 – Temporary
S – Solve flag

S1 – Amortization principal portion
S2 – Amortization interest portion
S3 – Remaining balance
T1 – Total principal and temporary
T2 – Total interest and temporary
T3 – Temporary
T4 – Temporary
V1 – Present value
V2 – Future value

Polynomial Solutions

Variable Definitions

I( ) – Imaginary part of coefficients
I1( ) – Working array containing imaginary part of coefficients
J( ) – Imaginary part of roots
R( ) – Real part of coefficients
R1( ) – Working array containing real part of coefficients
S( ) – Real part of roots
X( ), Y( ) – Siljak function where $Z^k = X(k) + i\,Y(k)$
A – Temporary
B – Temporary
C – Temporary
D – Temporary
D4 – Δx
D5 – Δv
F – $u^2 + v^2$, function value for Siljak Functions
G – Former value of F, used for convergence
I – Loop counter
K – Loop counter
L – Counter for checking convergence against maximum iterations
M – Quartering counter
N – Degree of polynomial; number of roots to be found
N1 – Temporary
P – $\delta u/\delta x$
Q – $\delta v/\delta x$
T – Temporary
T1 – Tolerance for functional evaluation
T2 – Tolerance for the root
U – Real part of F
V – Imaginary part of F
X – Current root approximation real part
Y – Current root approximation imaginary part
Z – Temporary used in computing Siljak Functions

Simultaneous Equations

Data Entry With Edit Options

In order to use a program, you must be able to enter, verify, and correct data values. The "Simultaneous Equations" program is designed to allow the user to do any of these options. By setting up the equations as an array, each row in the array contains the coefficients of an equation in the first N columns and the right hand side of the equation in the N + 1 column. The editing of the equations is reduced to specifying the array element to be edited. The print-out of the entire set of equations is accomplished by two nested FOR-NEXT loops which effectively associate the array elements with their respective equation and coefficient.

Storing data values in an array minimizes the addressing problems in specifying the individual elements and, therefore, simplifies any operations using the data.

Variable Definitions

A( ) - Absolute error vector
C(,) - System of equations as entered
D( ) - Vector $\bar{j}$
I( ) - Vector of pivot element row subscriptions, r_k
J( ) - Vector of pivot element column subscriptions, c_k
S( ) - Vector of solutions
T(,) - Working set of equations; the inverse of the original matrix is contained in the nxn matrix after the solutions are found.
Y( ) - Vector y, used in unscrambling the inverse matrix
D - Determinant of the inverted matrix
E - Minimum allowable magnitude, epsilon, for a pivot element
I - Loop counter
I2 - Loop counter
I4 - Temporary pointer
J - Loop counter
J2 - Loop counter
J4 - Temporary pointer
K - Loop counter
K1 - Temporary pointer
M - Number of columns in C(,)
N - Number of rows in C(,)
N1 - N−1

P – Pivot element
P1 – Temporary pointer
T – Number of pairwise interchanges required to order elements of D( )
T1 – Temporary
W – Equation number to edit

Calculus and Roots of f(x)

User Entered Function

In the "Calculus and Roots of $f(x)$" program, you are required to enter the function of interest at line 5000. Once this function has been stored, the program can then reference it and obtain functional values when needed. The following example should help to demonstrate these steps.

```
5000 DEF FNF(X)
5010 K=.5
5020 A=K*K*SIN(X*X)
5030 B=SQR(1-A)
5040 FNF=1/B
5050 FN END
```

The above function uses the variables, A, B, and K, as temporary storage values. It is important for you not to assign values to variables which are also used in the main program.

Before using variables as temporary storage locations, you should check for duplications in the calling program. The above example could have been written as one line as shown below:

```
5000 DEF FNF(X)=1/SQR(1-.5*.5*SIN(X*X))
```

The results would be the same and would not require any temporary storage locations.

Variable Definitions

A$ - Response string
E( ) - Accuracy vector
F( ) - Function value at root
R( ) - Root value
A - Roots lower bound temporary
A1 - Roots lower bound
B - Roots upper bound temporary
C - Iteration counter
D - %Δ
D1 - Δx
D2 - Derivative
E - Bad data flag
F - First iteration indicator
F1 - Print intermediate point flag

G – Integral value
G2 – Former integral value for convergence check
I – Iteration counter
I1 – Maximum number of interval halvings
L – Lower bound
M – Maximum number of bisections
N – Number of intervals
N1 – Number of roots
P – Product of function at different values for detecting root
R – Integration upper bound
S – Integration search increment
T – Error tolerance
X – Temporary argument for function
Y – Temporary function
Z – Temporary error value

Curve Fitting

Computed GOTO Branching

The "Curve Fitting" program uses many of the same routines for each of the regression types, with modifications for each type. The program flow within these routines is controlled by the regression type code using statements like line 1710: `1710 ON R GOTO 1720,1810,1840,1870`. The effect of line 1710 is to change the flow based on the regression, e.g., if $R = 1$ or linear regression, the program will branch to line 1720. Using this technique, program space can in some instances be used more efficiently. The major consideration is the trade-off between the savings obtained by using the same routines and the cost of branching to the same routines.

Variable Definitions

A( )	– Sums for regression
F$	– File name
M( )	– Sums for regression
R$	– Response string
V$	– Label temporary
X(,)	– Data values
Y( )	– Plotting extremes
Z$	– Label temporary
A	– Temporary storage
B	– Temporary storage
C	– Temporary storage
D	– Temporary storage
D1	– Distance of a dot in X-direction
D2	– Distance of a dot in Y-direction
D5	– Plot flag
E	– Temporary storage
E0	– Location of "E" in string
F	– Temporary storage
G9	– Temporary storage
I	– Loop counter
I1	– Loop counter
J	– Loop counter
K	– Loop counter
L	– Label length
L1	– Number of X-axis intervals

L2 – Number of Y-axis intervals
L3 – Number of X-intervals between labels
L4 – Number of Y-intervals between labels
L9 – Temporary storage
N – Number of points
Q1 – Temporary storage
Q2 – Temporary storage
Q3 – Temporary storage
Q4 – Temporary storage
Q5 – Temporary storage
R – Regression code
R5 – Temporary storage
S – Temporary storage
S7 – Y-label flag
S8 – X-label flag
S9 – Vertical/Horizontal label flag
T – Print routine or subroutine flag
T1 – Temporary storage
T2 – Temporary storage
V – Length of label
W – Temporary for label
W1 – Temporary for label
X – Label position and temporary
X0 – Scale X-minimum
X1 – X-value at axes intercept
X2 – X-value at right end of X-axis
X6 – Print data on input flag
Y – Label position
Y0 – Scale Y-minimum
Y1 – Y-value at axes intercept
Y2 – Y-value at top end of Y-axis
Z1 – X2−X1
Z2 – Y2−Y1
Z3 – X dot range
Z4 – Y dot range
Z5 – Scale X-maximum

Notes

Auto Function Plot

Scaling Data

The "Auto Function Plot" program employs a routine to scale a plot based on a specified range and the number of tic-intervals over this range. The major consideration in this routine is to minimize the errors which result when a fixed distance must be mapped onto a different range. This program maps your functional ranges onto the 256 × 192 dot matrix of the CRT. The routine makes allowances for labels on both axes and margins at the top and right side of the screen. Lines 1030 to 1100 compute the desired SCALE values and set up the scale for the plot. By studying this listing and the annotations the technique should be clarified.

```
1030 Z1=X2-X1
1040 Z3=INT(200/L1)*L1
1050 Z2=Y2-Y1
1060 Z4=INT(144/L2)*L2
1070 D1=Z1/Z3 @D2=Z2/Z4 @ Z5=X2+
     (207-Z3)*D1
1080 X0=X1-48*D1
1090 Y0=Y1-40*D2
1100 SCALE X0,Z5,Y0,Y2+(151-Z4)*
     D2
```

X-axis User range
X-axis CRT range
Y-axis User range
Y-axis CRT range
Dot distances and X scale max

X scale min
Y scale min

An attempt has been made to use consistent scaling routines in the entire Standard Pac. If you become familiar with this routine, the scaling routines used by other programs should be easily understood.

Variable Definitions

A$ – Response string
S( ) – Points of singularity
R$ – Response string
V$ – Label
D – Increment
D1 – Distance of a dot in X-direction
D2 – Distance of a dot in Y-direction
E – Position of "E" in label
F – Print temporary
G9 – Temporary storage
I – Loop counter
J – Loop counter
L – Label length
L1 – Number of X-axis intervals

L2 – Number of Y-axis intervals
L3 – Number of X-intervals between labels
L4 – Number of Y-intervals between labels
L9 – Label position
N – Number of plot increments
P – Plot flag
S – Number of singularity points
S1 – Auto Y-scale flag
S2 – Point of singularity flag
S7 – Y-label flag
S8 – X-label flag
S9 – Vertical/Horizontal label flag
T – Temporary storage
V – Length of label
W – Temporary for label
W1 – Temporary for label
X – Label position and temporary
X0 – Scale X-minimum
X1 – X-value at axes intercept
X2 – X-value at right end of X-axis
X3 – Plotting X-minimum
X4 – Plotting X-maximum
Y – Label position
Y0 – Scale Y-minimum
Y1 – Y-value at axes intercept
Y2 – Y-value at top end of Y-axis
Z1 – X2−X1
Z2 – Y2−Y1
Z3 – X dot range
Z4 – Y dot range
Z5 – Scale X-maximum

Histogram Generator

Data Storage and Retrieval

A major part of working with computational machines is the use of data. In many cases, the entry of data can be the most time consuming operation in running a program. If the same data is to be used again either in the same form or with minor editions, it is probably easier to store and later retrieve data from tape, than to re-enter the data. The "Histogram Generator" program allows the user to store and retrieve data. The subroutine at line 930 to 1020 shows the storage operations for the array A which contains the histogram data values.

Lines	Comments
930 ON ERROR GOTO 910	Set up for possible error
940 DISP "CREATE FILE:Y/N";	CREATE?
950 INPUT R$	
960 IF UPC$(R$[1,1])="Y" THEN CR EATE F$,8 @ GOTO 930	Yes—create it
970 IF UPC$(R$[1,1])#"N" THEN BE EP @ GOTO 940	Invalid answer
980 ASSIGN# 1 TO F$	Assign—(open buffer)
990 PRINT # 1 ; N,X()	Print count and array
1000 ASSIGN# 1 TO *	Close buffer
1010 OFF ERROR	Void error routine
1020 GOTO 1540	

The subroutine at lines 600 to 650 shows the retrieval operations for the array A which was stored using the storage subroutine above.

Lines	Comments
600 DISP "ENTER FILE NAME";	Enter file name
610 INPUT F$	
620 ON ERROR GOTO 600	Set up for possible error
630 ASSIGN# 1 TO F$	Assign—(open buffer)
640 READ# 1 ; N,X()	Read count and array
650 OFF ERROR	Void error routine

This example is a very simple example of data storage, but it should serve to demonstrate some of the power of data storage for you in your own applications.

Variable Definitions

B - Maximum number of values

B1 - Highest numbered cell with any points

C - Cell width and keyboard/tape entry flag

D1 – Distance of a dot in X-direction
D2 – Distance of a dot in Y-direction
E – Position of "E" in string
I – Loop counter
J – Loop counter
K – Temporary storage
L – Label length
L1 – Number of X-axis intervals
L2 – Number of Y-axis intervals
L3 – Number of X-intervals between labels
L9 – Label position
N – Number of points
N1 – Temporary storage for normal curve
N9 – Maximum number of points in a cell
O – Offset
P – Temporary counter
S2 – Sum of squares
S5 – Mean
S6 – Sample standard deviation
S9 – Vertical/Horizontal label flag
T – Sum of values and number of cells
T2 – Maximum value
T4 – Number of observations too small for offset
T5 – Number of observations too large for number of cells
V – Length of label
X – Temporary storage and label position
X0 – Scale X-minimum
X6 – Print data on input flag
Y – Temporary storage and label position
Y0 – Scale Y-minimum
Z0 – Temporary storage for number of cells to use for scaling plot
Z1 – C * Z0
Z2 – N9
Z3 – X dot range
Z4 – Y dot range = 120
Z5 – Scale X-maximum

Arithmetic Teacher

Pseudorandom Numbers

"Arithmetic Teacher" uses the random number generator in the machine to generate a sequence of numbers between zero and one. These numbers are then used to generate the problems displayed by the program.

The term "Pseudorandom" implies that the sequence of numbers is predictable from the algorithm and the initial value or seed used for the generator. A truly random device, such as a fair roulette wheel, is totally unpredictable. However, pseudorandom generators can be used to model random events provided they yield uniformly distributed numbers (i.e., as many values fall between 0.00 and 0.10 as fall between 0.10 and 0.20 etc.) and they do not repeat the same sequence of values during the simulation.

Line 3430 demonstrates how to convert the random numbers from zero to one to the range of integers used in the "Arithmetic Teacher."

```
3430 DEF FNR(X) = INT(M*RND+1)
```

Variable Definitions

A$ - Variable name
A1$ - Answer string
B$ - Variable names—"ABCJKUWXYZ"
S$ - Operator string
T$ - Temporary string
U$ - Operator string
V$ - Operator string
Z$ - Name of user
A - Value of answer
A1 - Problem constant
A2 - Problem constant
A3 - Problem constant
A4 - Problem constant
A5 - Problem constant
A6 - Answer to algebra problem
C - Lesson length
C7 - One more message flag
C8 - Halfway through message flag
D - Number of problems tried
F1 - Try flag

I – Loop counter
I9 – String pointer
M – Maximum factor
N1 – Problem constant
N2 – Problem constant
N3 – Problem constant
N4 – Problem constant
N5 – Problem constant for checking problem duplication
N6 – Answer to arithmetic problems
N9 – Temporary storage
O – Algebra type
S – Seed for random number generator
T – Mixed problem type
X – Count of problems answered correctly on first try
Y – Count of problems answered correctly on second try
Z – Count of problems missed on both tries

Calendar Functions

Multiple Storage in Variables

In "Calendar Functions" the dates are input in mm.ddyyyy format. This allows three pieces of information (the day, the month, and the year) to be carried in one variable. In "Calendar Functions", this provides a convenient means of entering and displaying the date.

When multiple storage techniques are used, two types of code are usually required. The first type breaks a combined number into its individual components. The second type assembles the individual components into a single number.

Lines 400 through 540 of "Calendar Functions" break the date into its individual components. The individual components are also checked for validity, though not exhaustively, since 2.311978 would be accepted.

```
400 M=INT(T)
410 IF M<1 OR M>12 THEN 550
420 T=T-M
430 D=INT(100*T)
440 T=100*T-D
450 Y=INT(10000*T)
460 S=Y+M/100+D/10000
470 IF S<1582.1015 OR S>4046.112
    5 THEN 550
480 IF D<1 OR D>31 THEN 550
490 IF M>2 THEN 520
500 M=M+12
510 Y=Y-1
520 M=M+1
530 J=INT(365.25*Y)-INT(Y/100)+I
    NT(Y/400)+INT(30.600*M)+D-4
    78164
540 RETURN
```

Line 970 of "Calendar Functions" assembles the three values into one number for display.

```
970 T=M1+D/100+Y1/1000000
```

Variable Definitions

A$ - Heading
B$ - Year
D$ - Days
C - Century

D – Day
D1 – Day of 1st date
D2 – Day of 2nd date
D3 – Δ days
E1 – Temporary storage for day
F1 – Temporary storage for month
G1 – Temporary storage for year
I – Loop counter
J – Julian date
J1 – Julian date of 1st date
J2 – Julian date of 2nd date
K – Temporary storage
L – Temporary storage
L1 – Label position
M – Month
M1 – Month of 1st date
M2 – Month of 2nd date
Q – Temporary storage
R – Temporary storage
S – YYYY.MMDD form of date
T – Date
R1 – First date
T2 – Second date
T9 – Temporary storage
W – Day of week
W1 – Number of weekdays of first date
W2 – Number of weekdays of second date
X – Function parameter
Y – Year
Y1 – Year of 1st date
Y2 – Year of 2nd date

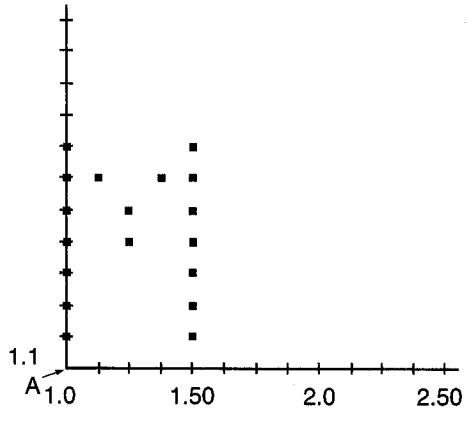
Label Positioning

Included in the graphics capability of your machine is the ability to label plots using the LABEL statement. The size of the characters is the same as the character size in alpha mode, but the positioning of these characters is much more flexible. Labels can be printed either horizontally or vertically by specifying the direction using the LDIR statement. The starting position is based on the last plotted point.

Lines 1680 to 1690 of the "Biorhythms" program shown below demonstrates horizontal labelling. The starting location is specified as (1,1.1) which is point A in figure 1.



```
1680 MOVE 1,1.1
1690 LABEL USING "#,A",VAL$(F2)
```

Lines 1720 to 1790 are used to label the X-axis with vertical labels. The scale used in this program was selected based on the resolution of labels in graphics. Vertical labels can start at every dot in the horizontal direction after allowing for the character height. If the horizontal scale was 0 to 255, vertical labels could start from 8 through 255. Since the scale used in the "Biorhythms" program is 0 to 31.875, the labels must start at 1 through 31.875 in units of .125. If the last plotted point does not map directly into one of these points, the labels may be one dot to the left or right of the expected location since the resolution of graphics is limited to the number of dots on the screen.

```
1720 MOVE 13,-1.15
1730 LABEL "DAYS"
1740 LDIR 90 @ MOVE 5.5,-.11
1750 LABEL "5"
1760 FOR I=10 TO 5 STEP 5
1770 MOVE I+.5,-.24
1780 LABEL VAL$(I)
1790 NEXT I
```

These examples should help you to see how labels are positioned in graphics. In most instances, the rounding of the coordinates used for positioning labels will not be of concern, but when this is not the case, the techniques used in the "Biorhythms" programs should be helpful.

Music Composer

Programmable BEEP

The "Music Composer" program uses the programmable BEEP instruction to generate the tones for the generated music. The parameters used by the BEEP instruction designate frequency and duration, but they are not in actual units. The relation between the BEEP parameters and actual frequency (F) and duration (T) are:

$$P1 = 613062.5/(11 * F) - 134/11$$
$$P2 = 613062.5/(11 * P1 + 134) * T$$

where

F = frequency in hertz
T = duration in seconds

The actual functions used by the program compensate for the time required to determine the type of array element and act accordingly.

Parse Techniques

In much the same manner as programs written in BASIC are converted into a form executable by a machine, the "Music Composer" program takes an input string and converts it into array elements which will be used to play music. This technique is called parsing. The program uses a simple set of rules, i.e., a grammar, to interpret the composition symbols. Once the program has determined what kind of symbol is currently being checked then program execution will branch accordingly. The lines form 510 to 940 are used to parse the entered composition string. The program checks the string by moving from position 1 to the end of the entered string a character at a time.

```
510 C=1 @ N1=N @ Q=0 @ O1=O @ T1
    =T @ B1=B
520 R$=R$&"   "
530 IF C>LEN(R$) THEN 490 ELSE P
    =POS(S$,R$[C,C])
540 IF P=28 THEN C=C+1 @ GOTO 53
    0
550 IF P THEN 580
560 DISP "? "&R$[C,C];" AT ";C
570 O=O1 @ T=T1 @ B=B1 @ N=N1 @
    GOTO 490
580 IF P<22 THEN Q=P @ GOTO 740
590 ON P-21 GOTO 740,610,680,600
    ,700,870,740
600 Q=-1 @GOTO 740
610 U=1
620 IF NOT FNP THEN 650
```

```
630 U=FNV
640 C=C+FNP
650 D=FNV
660 B=U/D @ C=C+2+(D>9)
670 GOTO 530
680 O=FNV @ C=C+2
690 IF O>6 OR O<1 THEN C=C-1 @ G
    OTO 560 ELSE 530
700 T(N,1)=0 @ T(N,2)=FNV
710 C=C+LEN(VAL$(T(N,2)))+1
720 T=60/T(N,2)
730 GOTO 850
740 C=C+1
750 IF Q#-1 THEN 770

    640
920 T(N,2)=R
930 GOTO 850
940 IF R2 THEN RETURN
```

By tracing the program flow in the subroutine when parsing the simple string, T8O3A, the technique should be clarified. We can assume that this is the first entry and that the timing factor is set at one. The effect of this input string is to set the timing and octave of the first note which is a natural A.

By following through this example, the technique of parsing should be simplified.

Variable Definitions

C1$ – Bass clef
F$ – File name
F1$ – Treble clef
N$ – Scale symbols
N1$ – Scale symbol code string
P$ – Parse string
R(,) – Repeat stack
R$ – Response string
S$ – Composing symbols
T(,) – Composed array
T$ – Scale with sharp symbols
B – Beats/sec
B1 – Temporary storage
B9 – Conversion constant
C – Counter
C2 – Power of two
D – Denominator
F – Flag and temporary storage
I – Loop counter
I9 – Temporary storage
J – Loop counter
L1 – Maximum size of array
M – Metronome
M1 – Metronome temporary storage
N – Array counter
N1 – Array counter temporary storage
O – Octave
O1 – Octave temporary storage
P – String pointer
P1 – String pointer
P2 – String pointer
P9 – Page count
Q – Symbol type
R – Repeat pointer
R1 – Repeat pointer
R2 – Repeat pointer
R3 – Last value to print
S – Starting value to print and temporary storage
S0 – Sharp flag

T – Beats per second timing
T1 – Timing temporary storage
U – Numerator of fraction for conversion
Y – Plot position for notes
Z – Insert/delete pointer and temporary storage
Z0 – Insert/delete pointer and temporary storage

Ski Game

Dynamic Variable Alteration

The user is able to change the value of the skier's lateral velocity by pressing the special function KEYS #3 and #4 while the program is running. The program execution is interrupted each time the special function key is pressed and then subroutines at lines 1520 and 1540 are executed before resuming program execution. These subroutines only increment and decrement the value of the variable F, but the technique can be carried much further. Programs could be written where this technique would allow the user to control the flow of a program, to specify the type of output desired, to specify the starting location of a label in graphics, etc.

```
30 ON KEY #3 GOSUB 1520
40 ON KEY #4 GOSUB 1540

1520 F=F-1
1530 RETURN
1540 F=F+1
1550 RETURN
```

Variable Color Graphics

The color of graphics operations is completely left to the user. The default mode of white lines on a black background can be over-ridden easily by changing the sense of the pen. The "Ski" program demonstrates the ability of user definable color. By setting the sense of the pen using a variable, you can easily change the mode of plotting since PEN −1 specifies black on white plotting and PEN 1 specifies white on black plotting. To plot in a different color you only need to execute a PEN 'color code' statement. In this program, the variable V9 contains the value of the selected mode. The ability to change modes allows you to blink labels as seen in lines 700 to 720.

```
700 PEN -V9 @ MOVE 73,0 @ LABEL
    "START" @ BEEP 15,10
710 PEN V9 @ MOVE 73,0 @ LABEL "
    START" @ BEEP 25,20
720 IF F THEN 700
```

By using this technique the user is able to enhance graphics in many ways by varying the color of the background and blinking labels.

Variable Definitions

F(,) – Left or top pole positions

G(,) – Right or lower pole positions

M( ) - Missed gate vector
P$ - Response string
A - Acceleration factor
B - Initial time
C - Temporary storage
C1 - Temporary storage
C2 - Temporary storage
C3 - Temporary storage
D - Temporary storage
D1 - Temporary storage
D2 - Temporary storage
D3 - Temporary storage
F - Key hit indicator
F1 - Repeat key indicator
G - Gate counter
I - Loop counter
K - Loop counter
M - Temporary storage
M1 - Temporary storage
P - Current Y position
Q - Ability level
R - Line intercept
S - Line intercept
S1 - Course code
T - Time
T1 - Time
V - Downward velocity
V8 - Background color entry
V9 - Pen setting
W - Lateral velocity
X - X-coordinate
X1 - X-coordinate
Y - Y-coordinate
Y1 - Y-coordinate

Appendix A

Use of 7225A Plotter

Various programs in the Standard Pac use CRT graphics. By following the instructions given here, these programs may be converted to run with the 7225A plotter.

The instructions for each program are listed below. After making the revisions be sure to execute the TRANSLATE command. To preserve the original programs, you must store these programs with a different name or on a different cartridge.

The new lines are shown for each program as well as the lines which must be deleted.

Program: MOVING

```
15 PLOTTER IS 705 @ CSIZE 7 @ DE
   G
1690 LDIR 90 @ LORG 7

These program modifications will produce reasonable plots. Special case data sets may need the axis labeling to be further modified. This can be easily done by referring to the locations which have been noted.

1000 N.E. Circle Blvd., Corvallis, OR 97330
